Surface Modification of Polymeric Biomaterials Buddy D. Ratner, David G. Castner, 2014-01-15

Surface Modification of Polymeric Biomaterials Buddy D. Ratner, David G. Castner, 2013-06-29 Applications of synthetic materials in medicine date back over 4000 years. The Egyptians used linen as sutures. In the Roman Empire gold was used in dentistry. Perhaps even earlier ivory and bone may have been used in the body by practitioners of the healing arts. The historical origins of modern biomaterials science are also hard to precisely trace but many of the ideas that define biomaterials as we know them today evolved in the late 1950s and early 1960s. Surface modification technology has played a prominent role in biomaterials science and has paralleled the evolution of the modern field. In a symposium organized by the Artificial Heart Program of the NIH National Heart Institute and the Artificial Kidney program of the NIH National Institute of Arthritis and Metabolic Diseases held in Atlantic City New Jersey in 1968 there were already a number of presentations on surface modification. Surface characterization at that time included scanning electron microscopy ellipsometry contact angle methods and infrared internal reflection methods.

Polymer Surface Modification K. L. Mittal, 2000-09-28 This book chronicles the proceedings of the Second International Symposium on Polymer Surface Modification Relevance to Adhesion held Newark New Jersey May 24-26 1999. Polymeric materials are intrinsically not very adhesionable and this necessitates their surface treatment to enhance their adhesion characteristics to other materials. Since the first symposium on this topic held in 1993 there has been a tremendous R Part 2 Other Miscellaneous Surface Modification Techniques and Part 3 General Papers. The topics covered include plasma surface modification of a variety of polymers using various plasma gases atmospheric plasma system surface functionalization ultrahydrophobic polymeric surfaces metallization of plasma treated polymers surface modification of polymers via molecular design for adhesion promotion wet chemical methods for polymer surface modification laser surface modification of various polymers UV ozone treatment surface and interface studies of treated polymer surfaces by an array of techniques bioadhesion of polymeric biomaterials to tissue polymer fiber systems and plasma deposited coatings.

Laser surface treatment of a polymeric biomaterial: David Garreth Waugh,Jonathan Lawrence,2014-02-01 Biotechnology has the potential to improve people s quality of life and holds the key to many unmet clinical needs In the UK alone the biotechnology market is worth 4 5 billion and estimates of future growth range from 10 to 15% This growth can only be driven by the increased use of inexpensive and easy to manufacture polymeric biomaterials Although polymer science is a rapidly developing area of research it remains that one of the most intractable problems encountered in biotechnology is that the performance of polymeric biomaterials depend upon both the bulk and surface properties In this book the authors describe their work using lasers to modify the wettability characteristics of nylon 6 6 as wetting is often the primary factor dictating the adhesion and bonding potential of materials as a route to enhancing the surface in terms of in vitro osteoblast cell response What is more modifying wettability characteristics in this way is shown to be a highly attractive means of estimating the biofunctionality of a polymer The book

demonstrates and explains how the generation of a biomimetic surface on polymers using laser beams provides an in vitro platform on which to deposit and grow cells for either the development of implants or to reconstitute functional tissue The correlative trends and generic characteristics which are identified in the book between the laser surface treatment wettability characteristics and osteoblast cell response of the nylon 6 6 provide a means to estimate the osteoblast cell response in vivo The book shows clearly that laser surface modification of polymeric materials has tremendous potential for application within the field of regenerative medicine *Biologically Modified Polymeric Biomaterial Surfaces* E.
