**The spider family Micropholcommatidae (Arachnida: Araneae: Araneoidea): a relimitation and revision at the generic level** Mihael G. Rix, Mark S. Harvey, 2010-02-22

The Micropholcommatidae are a family of tiny distinctive araneoid spiders known from southern temperate habitats throughout Australasia and Chile. The greatest abundance of individuals and the largest diversity of taxa occur in the cool temperate rainforests of south eastern Australia and New Zealand where micropholcommatid spiders can be very common within moss and leaf litter microhabitats. Although poorly studied biologically and largely neglected taxonomically, the Micropholcommatidae are a diverse lineage with a significant monograph in this volume presents a complete generic level revision of the spider family Micropholcommatidae. The phylogenetic position and internal phylogeny of the family are tested with two separate morphological cladistic analyses, the results of which inform a comprehensive generic level classification. In total, 26 new species, 12 new genera, one new tribe and two new subfamilies are described, taking the total documented micropholcommatid fauna to 58 species. The distribution and Gondwanan biogeography of the family are also discussed, and natural history information is provided where known. Most importantly, the results of this paper present a taxonomic framework and a phylogenetic foundation for all future research on the Micropholcommatidae, a template by which new species can be described and existing species can be identified, and a valuable dataset for exploring phylogenetic hypotheses.

The symphytognathoid spiders of the Gaoligongshan, Yunnan, China (Araneae: Araneoidea): Systematics and diversity of micro-orbweavers Jeremy Miller, Charles Griswold, Chang Yin, 2009-05-31

Over a period of 10 years, scientists from a coalition of international institutions surveyed the biota of the Gaoligong mountains in western Yunnan, China. Focal taxa included selected plants, vertebrates, and arthropods. The study area lies at the heart of one of the world's biodiversity hotspots and is home to biomes ranging from subtropical forest to tundra. In this special issue, we report on the results of that survey for micro-orbweaving spiders, cryptic animals mostly less than 1 mm long that build delicate geometric webs. All told, over 1,000 adult micro-orbweavers were collected and sorted to three dozen species, all new to science. The enormous scale of the world's biodiversity means that science needs data structures to facilitate organization, aggregation, and instant sharing of data. This publication contributes to major aggregators and indexers of electronic biodiversity data, including ZooBank, the Global Biodiversity Information Facility (GBIF), Morphbank, and the Encyclopedia of Life (EOL), supplementing the traditional paper mode. Typical of publications in taxonomy, this paper is composed of several components, including the primary biodiversity data (specimen locality and related information), media (e.g., photographs and drawings), text elements (e.g., species descriptions and nomenclature), and new taxonomic names. Once these elements are parsed and absorbed by community databases, they can be disseminated, indexed, and recombined in myriad ways inconceivable for static paper publications. The

barely imagined potential of these maturing digital resources makes the early 21st century a very exciting historical moment in taxonomy

**Spider Physiology and Behaviour** Jerome Casas, 2011-11-29 This latest volume in this series contains articles on Arachnid Physiology and Behaviour The papers in this special issue give rise to key themes for the future Contributions from the leading researchers in entomology Discusses Arachnid physiology and behavior Includes in depth reviews with valuable information for a variety of entomology disciplines

**Riceland Spiders of South and Southeast Asia** A. T. Barrion, J. A. Litsinger, 1995 This work which represents a major contribution to the literature for those interested in spiders or more generally in biological control and crop protection Spiders are among the most omnipresent and numerous predators in both agricultural and natural ecosystems and without them insect pest populations would go out of control Their potential as biological control agents can only be appreciated though a greater understanding of their abundance and species composition in different ecological systems There is a great need for literature providing guidance on spider identification This volume provides a comprehensive illustrated guide to the spider fauna of rice in South and Southeast Asia It is designed to be used by both specialists and novices The majority of the species covered were collected from a diversity of habitats in the Philippines The bulk of the book consists of keys to the identification of families genera and species of Philippine spiders illustrated by more than 1 000 line drawings and 92 color photographs A total of 341 species belonging to 134 genera within 26 families are recognized Of these 257 species and 8 genera are new to science Also provided are distribution maps for individual species and a classification scheme for Philippine riceland spiders

*The Evolution of Primary Sexual Characters in Animals* Janet Leonard, Alex Cordoba-Aguilar, 2010-07-19 Primary sexual traits those structures and processes directly involved in reproduction are some of the most diverse specialized and bizarre in the animal kingdom Moreover reproductive traits are often species specific suggesting that they evolved very rapidly This diversity long the province of taxonomists has recently attracted broader interest from evolutionary biologists especially those interested in sexual selection and the evolution of reproductive strategies Primary sexual characters were long assumed to be the product of natural selection exclusively A recent alternative suggests that sexual selection explains much of the diversity of primary

sexual characters A third approach to the evolution of reproductive interactions after copulation or insemination has been to consider the process one of sexual conflict That is the reproductive processes of a species may reflect as does the mating system evolution acting on males and on females but in different directions In this volume authors explore a wide variety of primary sexual characters and selective pressures that have shaped them from natural selection for offspring survival to species isolating mechanisms sperm competition cryptic female choice and sexual arms races Exploring diverse reproductive adaptations from a theoretical and practical perspective The Evolution of Primary Sexual Characters will provide an unparalleled overview of sexual diversity in many taxa and an introduction to the issues in sexual selection that are changing our view of sexual processes
