**Minerals Yearbook**, 1992      Learning from Disease in Pets Rebecca A. Krimins, 2020-11-25 Learning from Disease in Pets A One Health Model for Discovery is the first encompassing reference guide for veterinarians researchers and physicians on conducting studies using spontaneous models of disease in animals The study of naturally occurring disease in pet animals can help model our understanding of the biology prevention and therapy of human and animal diseases Studies of pet dogs for instance can aid treatment of complex medical problems such as cancer orthopedic cardiopulmonary and neuro inflammatory diseases and zoonotic infections Each chapter within this novel cross species approach is contributed by a leader or leaders in their field of research Using clinical trials to learn how pets with real diseases respond to therapy can lead to breakthroughs in human medicine as well as benefiting pets suffering from otherwise debilitating illness Despite similarities of diseases across species there are very few spontaneous models of disease used in research compared with models where disease is induced in healthy laboratory animals Many medical researchers and veterinarians have a multitude of questions regarding how to use naturally occurring diseases in pets for the discovery of treatments and diagnostics this book will demonstrate how to safely make this happen This book encourages veterinarians to build on and disseminate existing findings for the wider benefit of pets and humans Many pets suffering from incurable illnesses may benefit from clinical trials the book includes a section on the imperative communication styles necessary within the research environment and with clients a compelling discussion on the ethics of using pets in veterinary clinical research comprehensive tables of diseases that spontaneously occur in animals and humans the regulatory requirements necessary to move therapy from benchside research to patient bedside as well as intricate details on how to design a robust clinical study      Animal Models for Human Cancer Marianne I. Martic-Kehl, Pius August Schubiger, 2016-05-18 Based on results from the past ten years this ready reference systematically describes how to prepare carry out and evaluate animal studies for cancer therapies addressing the widely recognized lack of reliable and reproducible results Following a short historical introduction and a discussion of the ethics surrounding animal experiments the book describes correct study design as well as the handling and housing of animals It then goes on to describe the animal models available for different cancer types from natural cancer models in mice and dogs to humanized animals An evaluation of previously unpublished long term data from the Swiss canine and feline cancer registry is also included The final part of the book reviews the lessons learned over the last decade on how to interpret data from animal studies for improving human therapy and gives recommendations for future drug development

**Hodgkin's Lymphoma, An Issue of Hematology/Oncology** Volker Diehl, 2014-02-28 This issue of Hematology Oncology Clinics is focused on Hodgkin s Lymphoma and covers such topics as First HRS cell line L428 and the detection of the CD 30 Antigen Normal CD30 B lymphocytes CD 30 Antigen Combination Chemo Radiotherapy Early intensification escBEACOPP Customized Targeted Therapy and more      Positron Emission Tomography Birendra Kishore Das, 2014-12-04

This book provides basic information about the relatively new and evolving technology positron emission tomography for its clinical applications and practical guidance for the referring physicians Chapters cover application of PET in various clinical settings including oncology cardiology and neurology with a focus on role in various cancers Because most of the new PET equipments come as hybrid machines with CT or MRI two chapters have been included at the end of the book to provide basic and comprehensive information about these two technologies Molecular imaging is going to revolutionize the way we practice medicine in the future It will lead to more accurate diagnosis of diseases and its extent which will lead to better management and better outcomes In the history of medicine no imaging modality has ever become so popular for use in such a short time as has the PET technology PET imaging is mostly used in oncology neurology and cardiology but also finds application in other situations such as infection imaging The main focus of course is in management of cancer patients PET PET CT is not only very sensitive as it can detect changes in abnormal biochemical processes at cellular level but in one go all such areas can be detected in a whole body scan It can show response to therapy eradication of the disease or recurrence during the follow up period One of the main differences between a PET scan and other imaging tests like CT scan or MRI is that the PET scan reveals the cellular level metabolic changes occurring in an organ or tissue This is important and unique because disease processes begin with functional changes at the cellular level A PET scan can detect these very early changes whereas a CT or MRI detect changes much later as the disease begins to cause changes in the structure of organs or tissues Some cancers especially lymphoma or cancers of the head and neck brain lung colon or prostate in very early stage may show up more clearly on a PET scan than on a CT scan or an MRI A PET scan can measure such vital functions as blood flow oxygen use and glucose metabolism which can help to evaluate the effectiveness of a patient s treatment plan allowing the course of care to be adjusted if necessary Apart from its vital role in oncology it can estimate brain s blood flow and metabolic activity A PET scan can help finding nervous system problems such as Alzheimer s disease Parkinson s disease multiple sclerosis transient ischemic attack TIA amyotrophic lateral sclerosis ALS Huntington s disease stroke and schizophrenia It can find changes in the brain that may cause epilepsy PET scan is also increasingly being used to find poor blood flow to the heart which may mean coronary artery disease It can most accurately estimate the extent of damage to the heart tissue especially after a heart attack and help choose the best treatment such as coronary artery bypass graft surgery stenting or medical treatment It can also contribute significantly in identifying areas exactly where radiotherapy is to be targeted avoiding unnecessary radiation exposure to surrounding tissue
