Despite their abundance in marine ecosystems, studies on siphonophores are limited. In this study, 26 species of siphonophores in the Northwest Pacific Ocean were identified during multiple cruises of the R/V ISABU from 2018–2020, and various factors that may affect the occurrence of siphonophores, including water temperature, salinity, zooplankton biomass, and trophic niche were investigated. Statistical analysis revealed that the distribution of siphonophores and their biomass could be divided into two water mass groups, affected by the Kuroshio and Oyashio Currents. The species with high contributions to distinguishing the water mass groups (including *Chelophyes contorta*, *Dimophyes arctica*, *Bassia bassensis*, and *Eudoxoides spiralis*—mainly belonging to the Diphyidae) showed species-specific correlations with water temperature and salinity. This suggests that diphyids can be used as indicator species for currents and hydrological factors that influence water mass. The biomass of siphonophores exhibited a trend opposite to that of non-gelatinous zooplankton and showed no association with other gelatinous zooplankton. These results can be interpreted from an ecological niche perspective. Through nitrogen and carbon stable isotope analyses, the dietary sources of siphonophores could potentially overlap with those of chaetognaths or non-gelatinous zooplankton. Because the trophic position of siphonophores (2.4–3.2) also falls in the range of those of chaetognaths (2.8–3.4) and non-gelatinous zooplankton including copepods, euphausiids, and amphipods (2.4–3.5), diet competition with carnivorous mesozooplankton could be predicted. Considering that the diversity and biomass of most siphonophores are strongly positively correlated with water temperature and salinity, expansion of the Kuroshio Current is expected to lead to an increase in siphonophores in the Northwest Pacific in the future. The findings of this study are anticipated to provide novel insights into climate change prediction and response and enhance our understanding of siphonophore communities.

Marine Plankton Claudia Castellani, Martin Edwards, 2017 A thorough understanding of planktonic organisms is the first step towards a real appreciation of the diversity biology and ecological importance of marine life A detailed knowledge of their distribution and community composition is particularly important since these organisms are often very delicate and sensitive to change and can be used as early indicators of environmental change Natural and man induced modification of the environment can affect both the distribution and composition of plankton with important ecological and economic impacts Marine Plankton provides a practical guide to plankton biology with a large geographic coverage spanning the North Sea to the north eastern Atlantic coast of the USA and Canada The book is divided into three sections an overview of plankton ecology an assessment of methodology in plankton research covering sampling preservation and counting of samples and a taxonomic guide richly illustrated with detailed line drawings to aid identification This is an essential reference text suitable for senior undergraduate and graduate students taking courses in marine ecology particularly useful for fieldwork as well as for professional marine biologists It will also be of relevance and use to environmental scientists conservation biologists marine resource managers environmental consultants and other specialised practitioners

Ecological Geography of the Sea Alan R. Longhurst, 2010-08-03 This book presents an in depth discussion of the biological and ecological geography of the oceans It synthesizes locally restricted studies of the ocean to generate a global geography of the vast marine world Based on patterns of algal ecology the book divides the ocean into four primary compartments which are then subdivided into secondary compartments Includes color insert of the latest in satellite imagery showing the world s oceans their similarities and differences Revised and updated to reflect the latest in oceanographic research Ideal for anyone interested in understanding ocean ecology accessible and informative

Jellyfish Blooms IV Jennifer Purcell, Hermes Mianzan, Jessica R. Frost, 2015-03-21 Jellyfish generally are considered to be nuisances because they interfere with human activities by stinging swimmers clogging power plant intakes and nets of fishermen killing fish in aquaculture pens and being both predators and competitors of fish There is concern that environmental changes such as global warming eutrophication over fishing and coastal construction may benefit jellyfish populations During this past decade following the first Jellyfish Blooms volume some species have bloomed more frequently expanded their range and caused more problems for humans Mnemiopsis leidyi the ctenophore that invaded the Black Sea in the 1980s and damaged fisheries now also blooms in the North Baltic and Mediterranean seas Nemopilema nomurai a giant Asian jellyfish has bloomed frequently during this decade causing severe damage to the Japanese fishing industry Jellyfish Blooms Interactions with Humans and Fisheries is the fourth volume in this series Syntheses and original research articles address the question if jellyfish have increased globally and what factors may have contributed to the abundance of jellyfish This volume is the most extensive to date containing papers from all continents except Antarctica on scyphozoans hydrozoans cubozoans staurozoans and ctenophores and on the fate of jellyfish blooms This is a key reference for students and professional marine biologists oceanographers and fishery scientists and managers Previously published in Hydrobiologia vol 690 2012
