

ability to directly measure key engineering parameter values limit the applicability of performance specifications for geotechnical applications. Over time, advancements in measurement technologies will ideally reduce this obstacle.

Earthwork and Pavement Foundation Systems

Recent developments and improvements to in situ testing devices and integrated machine sensors (e.g., intelligent compaction rollers with accelerometer-based measurements of ground stiffness) have provided opportunities to develop more performance-oriented specifications in the areas of embankment and pavement subgrade and subbase construction.

Two specifications related to pavement foundation systems were prepared under the SHRP 2 R07 project and are included in Appendix C of the final report. The first, and perhaps easiest to implement, entails substituting traditional forms of proof rolling with roller-integrated compaction monitoring (RICM) proof mapping to verify that pavement subgrade support conditions are satisfactory. Compared with traditional proof rolling, proof mapping can provide

- Geospatially referenced documentation of an RICM measurement value (MV);
- Real-time information to the contractor during the construction process; and
- Results that can be correlated to subgrade support values, such as bearing capacity and stiffness.

The second specification represents a more comprehensive attempt to specify the construction of embankment and pavement foundation materials in terms of performance measures and quality statements. Key features of this specification include the following:

- Use of RICM technology to provide 100% sampling coverage to identify areas needing further work;
- Acceptance and verification testing, using performance measures and parameters—such as elastic modulus testing, shear strength, and permeability—that relate to design assumptions;
- Protocols for establishing target values for acceptance;
- Quality statements and assessment methods that require achievement of at least some overall minimal value during construction and achievement of a minimum level of spatial uniformity in a given lot area; and
- Protocols for data analysis and reporting such that the construction process is field-controlled in an efficient manner to ensure the final product meets design assumptions.

The specification contains two different implementation options.

1. RICM-MV maps to target locations for QA performance point measurements. RICM-MV georeferenced maps are used in this specification option to identify “weak” areas on which to focus QA point measurements. Proper QC measures
