*Mathematical Scattering Theory* Dmitri Raelin Afaev, 2010-03-10 The main subject of this book is applications of methods of scattering theory to differential operators primarily the Schrodinger operator There are two different trends in scattering theory for differential operators The first one relies on the abstract scattering theory The second one is almost independent of it In this approach the abstract theory is replaced by a concrete investigation of the corresponding differential equation In this book both of these trends are presented The first half of this book begins with the summary of the main results of the general scattering theory of the previous book by the author Mathematical Scattering Theory General Theory American Mathematical Society 1992 The next three chapters illustrate basic theorems of abstract scattering theory presenting in particular their applications to scattering theory of perturbations of differential operators with constant coefficients and to the analysis of the trace class method In the second half of the book direct methods of scattering theory for differential operators are presented After considering the one dimensional case the author returns to the multi dimensional problem and discusses various analytical methods and tools appropriate for the analysis of differential operators including among others high and low energy asymptotics of the Green function the scattering matrix ray and eikonal expansions The book is based on graduate courses taught by the author at Saint Petersburg Russia and Rennes France Universities and is oriented towards a reader interested in studying deep aspects of scattering theory for example a graduate student in mathematical physics
