Speech Dynamics:

Speech Dynamics Felicitas Kleber, Tamara Rathcke, 2024-10-07 The relationship between diachronic change and synchronic variation at the articulatory auditory acoustic and social level is one of the greatest puzzles in the study of language Even though plentiful examples exist to suggest that dynamics of synchronic variation and diachronic change are tightly interconnected a unified theory to account for language change in its relationship to all layers of synchronic variation remains a desideratum This volume compiles new evidence from articulatory acoustic auditory sociolinguistic and phonological analyses of segmental and prosodic data and computational modelling and offers a refreshing theoretical angle on the ongoing debates in language change The volume is divided into three sections each focusing on one aspect of speech dynamics the historical the emerging and the theoretical each making a step toward a unified view of speech dynamics at the interface of synchronic variation and diachronic change The large range of methodologies and theories represented in this book will appeal to scholars from a variety of linguistic fields with an interest in speech dynamics including phoneticians phonologists sociolinguists typologists computational and historical linguists Dynamics of Speech Production and Perception

P.L. Divenyi, S. Greenberg, G. Meyer, 2006-09-20 That speech is a dynamic process strikes as a tautology whether from the standpoint of the talker the listener or the engineer speech is an action a sound or a signal continuously changing in time This book presents a collection of papers which looks at speech as a dynamic process and highlights its particularities

Dynamic Speech Models Li Deng, 2022-05-31 Speech dynamics refer to the temporal characteristics in all stages of the human speech communication process This speech chain starts with the formation of a linguistic message in a speaker's brain and ends with the arrival of the message in a listener's brain Given the intricacy of the dynamic speech process and its fundamental importance in human communication this monograph is intended to provide a comprehensive material on mathematical models of speech dynamics and to address the following issues How do we make sense of the complex speech process in terms of its functional role of speech communication How do we quantify the special role of speech timing How do the dynamics relate to the variability of speech that has often been said to seriously hamper automatic speech recognition How do we put the dynamic process of speech into a quantitative form to enable detailed analyses And finally how can we incorporate the knowledge of speech dynamics into computerized speech analysis and recognition algorithms The answers to all these questions require building and applying computational models for the dynamic speech process What are the compelling reasons for carrying out dynamic speech modeling We provide the answer in two related aspects First scientific inquiry into the human speech code has been relentlessly pursued for several decades As an essential carrier of human intelligence and knowledge speech is the most natural form of human communication Embedded in the speech code are linguistic as well as para linguistic messages which are conveyed through four levels of the speech chain Underlying the robust encoding and transmission of the linguistic messages are the speech dynamics at all the four levels Mathematical

modeling of speech dynamics provides an effective tool in the scientific methods of studying the speech chain. Such scientific studies help understand why humans speak as they do and how humans exploit redundancy and variability by way of multitiered dynamic processes to enhance the efficiency and effectiveness of human speech communication. Second advancement of human language technology especially that in automatic recognition of natural style human speech is also expected to benefit from comprehensive computational modeling of speech dynamics. The limitations of current speech recognition technology are serious and are well known. A commonly acknowledged and frequently discussed weakness of the statistical model underlying current speech recognition technology is the lack of adequate dynamic modeling schemes to provide correlation structure across the temporal speech observation sequence. Unfortunately due to a variety of reasons the majority of current research activities in this area favor only incremental modifications and improvements to the existing HMM based state of the art. For example while the dynamic and correlation modeling is known to be an important topic most of the systems nevertheless employ only an ultra weak form of speech dynamics e.g. differential or delta parameters. Strong form dynamic speech modeling which is the focus of this monograph may serve as an ultimate solution to this problem. After the introduction chapter the main body of this monograph consists of four chapters. They cover various aspects of theory, algorithms and applications of dynamic speech models and provide a comprehensive survey of the research work in this area spanning over past 20 years. This monograph is intended as advanced materials of speech and signal processing for graduate level teaching for professionals and engineering practitioners as well as for seasoned researchers and engineers specialized in speech processing.

Speech: A dynamic process René Carré, Pierre Divenyi, Mohamad Mrayati, 2017-04-24. Speech A dynamic process takes readers on a rigorous exploratory journey to expose them to the inherently dynamic nature of speech. The book addresses an intriguing question: Based only on physical principles alone, can the exploitation of a simple acoustic tube evolve into an optimal speech production system comparable to the one we possess? In the work presented, the tube is deformed step by step with the sole criterion of expending minimum effort to obtain maximum acoustic variations. At the end of this process, the tube is found divided into distinctive regions and an acoustic space emerges capable of generating speech sounds. Attaching this tube to a model, an inherently dynamic and efficient system is created. In the resulting system, optimal primitive trajectories are seen to naturally exist in the acoustic space and the regions defined in the tube correspond to the main places of articulation for oral vowels and plosive consonants. All this implies that these speech sounds are inherent properties of not only the modeled acoustic tube but also of the human speech production system. This book stands as a valuable resource for accomplished and aspiring speech scientists as well as for other interested persons in search for an introduction to speech acoustics that takes an unconventional path.

, *Nonlinear Dynamics in Human Behavior* Raoul Huys, Viktor K. Jirsa, 2010-12-09. Humans engage in a seemingly endless variety of different behaviors of which some are found across species while others are conceived of as typically human. Most generally, behavior comes about through the

interplay of various constraints informational mechanical neural metabolic and so on operating at multiple scales in space and time Over the years consensus has grown in the research community that rather than investigating behavior only from bottom up it may be also well understood in terms of concepts and laws on the phenomenological level Such top down approach is rooted in theories of synergetics and self organization using tools from nonlinear dynamics The present compendium brings together scientists from all over the world that have contributed to the development of their respective fields departing from this background It provides an introduction to deterministic as well as stochastic dynamical systems and contains applications to motor control and coordination visual perception and illusion as well as auditory perception in the context of speech and music
