   Robust Automatic Speech Recognition Jinyu Li,Li Deng,Reinhold Haeb-Umbach,Yifan Gong,2015-10-30 Robust Automatic Speech Recognition A Bridge to Practical Applications establishes a solid foundation for automatic speech recognition that is robust against acoustic environmental distortion It provides a thorough overview of classical and modern noise and reverberation robust techniques that have been developed over the past thirty years with an emphasis on practical methods that have been proven to be successful and which are likely to be further developed for future applications The strengths and weaknesses of robustness enhancing speech recognition techniques are carefully analyzed The book covers noise robust techniques designed for acoustic models which are based on both Gaussian mixture models and deep neural networks In addition a guide to selecting the best methods for practical applications is provided The reader will Gain a unified deep and systematic understanding of the state of the art technologies for robust speech recognition Learn the links and relationship between alternative technologies for robust speech recognition Be able to use the technology analysis and categorization detailed in the book to guide future technology development Be able to develop new noise robust methods in the current era of deep learning for acoustic modeling in speech recognition The first book that provides a comprehensive review on noise and reverberation robust speech recognition methods in the era of deep neural networks Connects robust speech recognition techniques to machine learning paradigms with rigorous mathematical treatment Provides elegant and structural ways to categorize and analyze noise robust speech recognition techniques Written by leading researchers who have been actively working on the subject matter in both industrial and academic organizations for many years   **The Voice in the Machine** Roberto Pieraccini,2012-03-23 An examination of more than sixty years of successes and failures in developing technologies that allow computers to understand human spoken language Stanley Kubrick s 1968 film 2001 A Space Odyssey famously featured HAL a computer with the ability to hold lengthy conversations with his fellow space travelers More than forty years later we have advanced computer technology that Kubrick never imagined but we do not have computers that talk and understand speech as HAL did Is it a failure of our technology that we have not gotten much further than an automated voice that tells us to say or press 1 Or is there something fundamental in human language and speech that we do not yet understand deeply enough to be able to replicate in a computer In The Voice in the Machine Roberto Pieraccini examines six decades of work in science and technology to develop computers that can interact with humans using speech and the industry that has arisen around the quest for these technologies He shows that although the computers today that understand speech may not have HAL s capacity for conversation they have capabilities that make them usable in many applications today and are on a fast track of improvement and innovation Pieraccini describes the evolution of speech recognition and speech understanding processes from waveform methods to artificial intelligence approaches to statistical learning and modeling of human speech based on a rigorous mathematical model specifically

Hidden Markov Models HMM He details the development of dialog systems the ability to produce speech and the process of bringing talking machines to the market Finally he asks a question that only the future can answer will we end up with HAL like computers or something completely unexpected *Speech Recognition by Machine* Renato Adrian Frizzo,1979 <u>The Recognition of Speech by Machine</u> Arthur S. Meyer,2010-11 While human listeners have little problems in dealing with the strong variation in spoken language the same cannot be said about automatic speech recognition ASR This work compares recognition performance of man and machine with the aim of learning from the distinct errors between these two Based on the differences the signal processing mechanisms are analyzed that are suitable to increase the robustness of ASR The comparison focuses on the influence of intrinsic variation of speech i e changes in speaking rate effort and style as well as dialect and accent The outcome of the experiments suggests that the processing of temporal cues in ASR bears room for improvement Therefore spectro temporal features are employed as input to ASR systems which results in an increase of recognition performance for varying speaking effort and speaking style compared to standard features This documents the usefulness of spectro temporal and temporal information for automatic recognizers   *Speech Separation by Humans and Machines* Pierre Divenyi,2006-01-16 There is a serious problem in the recognition of sounds It derives from the fact that they do not usually occur in isolation but in an environment in which a number of sound sources voices traffic footsteps music on the radio and so on are active at the same time When these sounds arrive at the ear of the listener the complex pressure waves coming from the separate sources add together to produce a single more complex pressure wave that is the sum of the individual waves The problem is how to form separate mental descriptions of the component sounds despite the fact that the mixture wave does not directly reveal the waves that have been summed to form it The name auditory scene analysis ASA refers to the process whereby the auditory systems of humans and other animals are able to solve this mixture problem The process is believed to be quite general not specific to speech sounds or any other type of sounds and to exist in many species other than humans It seems to involve assigning spectral energy to distinct auditory objects and streams that serve as the mental representations of distinct sound sources in the environment and the patterns that they make as they change over time How this energy is assigned will affect the perceived n ber of auditory sources their perceived timbres loudnesses positions in space and pitches   *Privacy-Preserving Machine Learning for Speech Processing* Manas A.
