intelligence to carry out actions that were once only doable by governments militaries or institutions with considerable resources Essentially Promethean technologies allow users to create their own weapons of mass destruction These emerging technologies are increasingly affordable and accessible and are no more complicated to operate than a satellite TV control box or a smart phone Although these technologies are a terrifying prospect the more we know about these dangers the better we can prepare to head them off In *The Devil's Toy Box* Andrew Fox lays out seven decades of preemptive analysis and shows that while homeland security has explored in depth the possible Promethean threats the world faces it has failed to forecast the most likely attacks Using fictional scenarios Fox teaches how to predict future threats and how to forecast which ones are likely to be used by bad actors within the next five to ten years Combining the skills of homeland security experts and the imaginations of speculative fiction writers he then offers an analytical method to deter counter or abate these threats rather than adopting an attitude of resigned fatalism

Probing auditory scene analysis Elyse S Sussman, Susan Denham, Susann Deike, 2015-02-11 In natural environments the auditory system is typically confronted with a mixture of sounds originating from different sound sources As sounds spread over time the auditory system has to continuously decompose competing sounds into distinct meaningful auditory objects or auditory streams referring to certain sound sources This decomposition work which was termed by Albert Bregman as Auditory scene analysis ASA involves two kinds of grouping to be done Grouping based on simultaneous cues such as harmonicity and on sequential cues such as similarity in acoustic features over time Understanding how the brain solves these tasks is a fundamental challenge facing auditory scientist In recent years the topic of ASA was broadly investigated in different fields of auditory research including a wide range of methods studies in different species and modeling Despite the advance in understanding ASA it still proves to be a major challenge for auditory research This includes verifying whether experimental findings are transferable to more realistic auditory scenes A central approach in understanding ASA is the use of certain stimulus parameters that produce an ambiguous percept The advantage of such an approach is that different perceptual organizations can be studied without varying physical stimulus parameters Additionally the perception of ambiguous stimuli can be volitionally controlled by intention or task By using this one can mirror real hearing situations where listeners intent to identify and to localize auditory sources Recently it was also found that in classical auditory streaming sequences perceptual ambiguity was not restricted to but was observed over a broad range of stimulus parameters The proposed Research Topic pursues to bring together scientist in the different fields of auditory research whose work addresses the issue of perceptual ambiguity Researchers were welcome to contribute experimental reports computational modeling and reviews that consider auditory ambiguity in its modality specific characteristics as well as in comparison to visual ambiguous figures The overall goal of contributions was to consider the experimental findings from the perspective of real auditory scenes In a broader sense the Research Topic was open for contributions which are related to the issue of active listening in complex scenes
