Splitting Extrapolation Method:

Splitting Extrapolation Method, the: A New Technique In Numerical Solution Of Multidimensional Prob C B

Liem, Tsimin Shih, 1995-09-30 The splitting extrapolation method is a newly developed technique for solving multidimensional mathematical problems It overcomes the difficulties arising from Richardson's extrapolation when applied to these problems and obtains higher accuracy solutions with lower cost and a high degree of parallelism The method is particularly suitable for solving large scale scientific and engineering problems This book presents applications of the method to multidimensional integration integral equations and partial differential equations It also gives an introduction to combination methods which are relevant to splitting extrapolation The book is intended for those who may exploit these methods and it requires only a basic knowledge of numerical analysis

Parallel Multilevel Methods Gerhard

Zumbusch,2012-12-06 Numerical simulation promises new insight in science and engineering In addition to the traditional ways to perform research in science that is laboratory experiments and theoretical work a third way is being established numerical simulation It is based on both mathematical models and experiments conducted on a computer The discipline of scientific computing combines all aspects of numerical simulation The typical approach in scientific computing includes modelling numerics and simulation see Figure 1 Quite a lot of phenomena in science and engineering can be modelled by partial differential equations PDEs In order to produce accurate results complex models and high resolution simulations are needed While it is easy to increase the precision of a simulation the computational cost of doing so is often prohibitive Highly efficient simulation methods are needed to overcome this problem This includes three building blocks for computational efficiency discretisation solver and computer Adaptive mesh refinement high order and sparse grid methods lead to discretisations of partial differential equations with a low number of degrees of freedom Multilevel iterative solvers decrease the amount of work per degree of freedom for the solution of discretised equation systems Massively parallel computers increase the computational power available for a single simulation
