Supply Chain Planning Hans-Otto Günther, Herbert Meyr, 2009-03-05 In recent years supply chain planning has emerged as one of the most challenging problems in the industry As a consequence the planning focus is shifting from the management of plant specific operations to a holistic view of the various logistics and production stages that is an approach in which suppliers production plants and customers are considered as constituents of an integrated network A major driving force behind this development lies in the

globalization of the world economy which has facilitated the co operation between different partners working together in world wide logistics networks Hence considerable cost savings can be gained from optimizing the structure and the operations of complex supply networks linking plants suppliers distribution centres and customers Consequently to improve the performance of the entire logistic chain more sophisticated planning systems and more effective decision support are needed Clearly successful applications of supply chain management have driven the development of advanced planning systems APS which are concerned with supporting decision making activities at the strategic tactical and operational decision level These software packages basically rely on the application of quantitative methods which are used to model the underlying complex decision problems considering the limited availability of resources and the need to react on time to customer orders The core module at the mid term level of APS comprises operational supply chain planning In many industries production stages are assigned to different plants and distribution centres have been established at geographically dispersed locations

Developing a Framework for Supply Chain Planning in Construction Micael Thunberg, 2016-09-28 Supply chain management SCM has been stressed as a remedy to many of the underlying issues in the construction industry However the positive examples where SCM has been successfully utilised and diminished the lingering issues in construction is scarce The question is why Previous studies have stressed the importance of planning both the construction project as such but also the supply chain and the logistics As an important part of SCM supply chain planning SCP focuses on planning different aspects of the supply chain through involving

different members of the supply chain in the planning process SCP in construction is scarce as the planning of the logistics in general Failing to plan the supply chain involving supply chain members in the planning and integrating the processes of planning the supply chains and the construction project can be one reason for the low numbers of successful SCM adoption in construction In improving the SCP in construction this thesis develops a SCP framework for construction that involves the main contractor subcontractors and suppliers The aim is to improve SCP collaboration and eliminate many of the common problems in construction through a SCM and SCP perspective The developed framework is based on an existing planning framework for sales and operations planning This framework is generic and synthesises planning in general It consists of identifying developing outcomes input organisation process key performance measurements and IT tools It is thus necessary to investigate what these aspects means in a construction context Four research objects will be fulfilled Objective 1 Identify common logistical problems and linkages between them Objective 2 Develop a SCP process Objective 3 Develop a SCP organisation Objective 4 Identify performance measurements
