connection between gut flora dysbiosis and liver damage 1 The impairment of hepatocyte survival by toxic compounds generated by intestinal bacteria 2 The triggering of immune inflammatory processes by toxic compounds generated by dysbiotic bacteria in the gut and transported to the liver 3 The genotoxicity on liver cells of gut bacterial mediators 4 The epigenetic modifications in the hepatocytes induced by intestinal bacteria 5 The impairment of the enterohepatic circulation of bile acids 6 The connection between microbiota induced NAFLD NASH and the risk of DILI 7 The conversion of orally given drugs into toxic metabolites through bacterial metabolism taking place in the gut lumen 8 The disruption of the integrity of the epithelial intestinal barrier with the consequent bacterial translocation through a direct action of drugs on the intestinal mucosa 9 The modulation by the gut microbiota of the rewarding potential of hepatotoxic drugs of abuse leading to an increase in craving for these substances and ultimately in their intake and liver toxicity 10 The hypothesis that strategies aiming to modify the composition of gut microbiota with probiotics prebiotics symbiotics could ameliorate or prevent liver diseases
