complicated theory thus making its conclusions easily accessible to any student of natural history African predators or social behavior within animal communities The Spotted Hyena features exciting field notes in addition to comprehensive graphs and tables that have made it an invaluable contribution to behavioral ecology and its methodology Hans Kruuk studied hyenas while living in the wilderness of Africa's Serengeti and Ngorongoro Crater for many years After completing his doctorate with Nobel Prize winner Niko Tinbergen at the University of Oxford Kruuk was asked by the former Tanganyika now Tanzania National Parks to study predation in the Serengeti Kruuk focused on the most important carnivore there the spotted hyena and co founded the Serengeti Research Institute in Tanzania to carry out his research Many years later in 1997 he retired emeritus from his position as Senior Principal Research Officer at the Institute of Terrestrial Ecology in Banchory Scotland Kruuk has carried out research projects on mammals and birds on all continents published seven books and over 120 scientific papers Among his awards are scientific medals from the Zoological Society of London and British Mammal Society and secondary Doctorate of Science from the University of Aberdeen where he is also Honorary Professor

These considerations are based on estimates of the population densities of the available prey species and on estimates of the relative difficulty of hunting those species. The results demonstrate that when Neanderthals operated within poor environments their prey choice was constrained; they were not able to hunt species living in large herds. In these environments, solitary species were the preferred prey. It is striking that Neanderthals successfully focussed on the largest and most dangerous species in poor environments. However, in richer environments these constraints were lifted and species living in herds were successfully exploited. In order to assess the accuracy of this approach, bone assemblages formed by cave hyenas are also analysed. The combined results of the Neanderthal and hyena analyses show that an optimal foraging perspective provides a powerful tool to increase our understanding of Pleistocene ecology. The niches of two social carnivores of similar size which were seemingly similar are successfully distinguished. This result lends extra credence to the conclusions regarding Neanderthal foraging strategies. This book contributes to the debate surrounding Neanderthal competence and ability. It combines an up to date review of current knowledge on Neanderthal biology and archaeology with novel approaches to the archaeological record. It is thus an important contribution to the current knowledge of this enigmatic species.

Female Spotted Hyenas Jaclyn Jaycox, 2022-01-08. A group of spotted hyenas has just killed a gazelle. It's time to eat. But not every hyena digs in at once. The females eat first. Next cubs eat, and then the males. In a hyena clan, females rule. They hunt, care for young, and protect the clan's territory. Take a look at spotted hyenas and the important roles females play to ensure the clan's survival.

The Hunters Or the Hunted? C. K. Brain, 1983-08. Amongst scientists involved in taphonomy, C. K. Brain stands out as the pioneer. This impressive book is a statement of his investigations. *The Hunters or the Hunted* is a very important book for paleoanthropology. It presents the first thorough analysis of the Sterkfontein Valley assemblages, contributes significantly to the resolution of lingering controversies, and by placing the old information in a fresh perspective, enables new and more sophisticated questions to be asked, not only of the South African material but of similar assemblages elsewhere. Another contribution is that it reinforces the recent change in feelings as to what constitutes data for the value of looking at fossil and contemporary bones as closely as this is clear. Brain urges the necessity of recovering fossils with a high regard for subtle detail. I hope excavators of any vertebrate fossil site will be persuaded to follow his advice and pay more attention to these features of bone accumulations that have been previously neglected. For taphonomy can be a powerful tool in elucidating the problems of fossil assemblages, especially when handled with the care and caution that Brain brings to the subject.

encourage realistic conservation programs to manage rapidly diminishing populations and will elucidate particular features of the carnivores for nonspecialist readers

Hyenas Bite! Janey Levy, 2020-07-15 Hyenas have a bad reputation as cowardly scavengers. In movies such as *The Lion King* they are portrayed as villains but hyenas are actually Africa's most successful predators. Young readers will discover fascinating facts about these intriguing intelligent animals. Special attention is paid to their bite: how it works and the role it plays in their diet. Fact boxes and a graphic organizer supplement the age appropriate narrative that addresses important science concepts. Striking photographs will make readers feel like they are on a hyena wildlife safari.

The Nile Mosaic of Palestrina Paul G.P. Meyboom, 2015-08-24 The famous Nile Mosaic of Palestrina (ancient Praeneste) in central Italy, dating to c. 100 B.C., is one of the earliest large mosaics which have been preserved from the classical world. It presents a unique comprehensive picture of Egypt and Nubia. The interpretation of the mosaic is disputed, suggestions ranging from an exotic decoration to a topographical picture or a religious allegory. The present study demonstrates that the mosaic depicts rituals connected with Isis and Osiris and the yearly Nile flood. The presence of these Egyptian religious scenes at Praeneste can be explained by the assimilation of Isis and Fortuna, the tutelary goddess of Praeneste, and by the interpretation of the mosaic as a symbol of divine providence.
