federalhealth.net/surgical-techniques-for-knee-replacement

Minimally invasive surgical techniques are used in the reconstruction of the ligaments of the knee joint. Knee Replacement takes place under the control of a camera and a very small lens that allows you to observe the inside of the joint.

Reconstruction of the joint instead of a large, several-centimetre-long wound procedure is performed through two 5-8 mm incisions. Patient recovery is facilitated, and perioperative infections are reduced.

Nonsurgical treatment methods are not effective – they do not remove the root cause of the disease. The aim of treatment is to restore the anatomical and biomechanical function of the cruciate ligament and thus prevent the development of early degenerative changes.

The damaged ligament can be replaced with a graft of other patient tissue. The most commonly used are grafts derived from the patient's flexor tendons. In the reconstruction, we use the anatomical technique of introducing and setting the graft. The extensive introduction of the arthroscopic procedure and cooperation with a **Joint replacement surgeon** in the rehabilitation of the musculoskeletal system enables the period of post operative rehabilitation to be shortened to a minimum.

Indications for Surgery

The indication for the reconstruction of the anterior cruciate ligament is the patient's felt instability of the joint, "insecurity", and "running away".
