Abstract: The number of patients with cholelithiasis and endocrine pathology increases in old age and old age. Age of the patient over 60 years is one of the risk factors of complications after cholecystectomy. In old age the number of patients with cholelithiasis and endocrine pathology increases. The patient's age over 60 years is one of the risk factors of complications after cholecystectomy.

Key words: cholelithiasis, endocrine disorders, advanced age and old age.

Introduction: Biliary stone disease (BCD) is diagnosed in 10-20% of adults in economically developed countries. Endocrine diseases (ED) and metabolic disorders play an important role in the occurrence of gallstones [1, 4]. In the older age group the number of persons with both cholelithiasis and endocrine pathology is increasing [8]. Therefore, a number of elderly and senile patients are simultaneously diagnosed with cholelithiasis and EH. Surgical method is considered to be the leading one in treatment of patients with cholelithiasis [9]. Despite the widespread introduction of minimally invasive techniques and improved preoperative preparation, the age of the patient over 60 years remains a risk factor for postoperative complications (POC). Complications occur in 5-24% of patients operated on for GI in old age and old age, and postoperative mortality in the older age group reaches 0.48-0.7% [5, 9]. However, the influence of ex and metabolic disorders on the course of perioperative period in persons over 60 years of age with cholelithiasis is insufficiently studied.

Purpose of the study – To investigate the influence of endocrine pathology on the immediate results of surgical treatment of GI patients in old age and old age.

Material and methods of research: From 2015 to 2021, 295 patients with cholelithiasis were operated on in the Department of Abdominal Surgery. There were 206 (69.8%) women and 89 (30.2%) men. GSD was diagnosed based on the results of physical, laboratory and ultrasound examinations. After the operation a histological study of the removed gallbladder (BP) was performed. In addition, screening for metabolic syndrome (MS), thyroid pathology, calcium metabolism disorders and adrenal gland diseases was performed.

Surgery for Endocrinological Diseases and Malformations in Childhood Michael W.L. Gauderer, Thomas A. Angerpointner, 2012-12-06
Endocrine conditions requiring surgical intervention in the pediatric age group are uncommon. When diagnosed they are the source of great interest and often considerable debate. This is understandable since few centers and even fewer individual surgeons can draw on vast experience of this subject. The great divergence of opinion regarding management is also understandable in that pediatric endocrine lesions often differ considerably from their adult counterparts in histology, natural history and response to treatment. Pediatric endocrine lesions are also as a rule less frequently malignant. In addition to the great strides made in surgical and anesthetic technique and operative monitoring, progress in four areas has substantially advanced the management of endocrine disorders in the pediatric age group in the last decade: imaging, pathology, pharmacology and genetics. The new imaging tools, ultrasonography, computed tomography and magnetic resonance imaging, have added great diagnostic possibilities. More recent developments such as radio nuclide imaging for the adrenal gland and the possibility of using tagged antibodies promise to expand our imaging horizons even further. In the field of pathology, the development of immunocytochemical markers, e.g. monoclonal antibodies, the refinement in special stains and the continuous perfection of fine needle aspiration biopsies offer great new diagnostic as well as research capabilities. Newer pharmacological agents such as the alpha and beta blockers, the calcium channel blockers and thyroxine analogs add a whole new level of safety to the management of the potentially lethal pheochromocytoma.

This book provides a comprehensive guide for selective venous sampling procedures and the role of interventional radiologists in the care and treatment of patients with endocrine disorders. Disorders of the endocrine system involve an imbalance in the natural homeostasis of the hormones produced by the glands in the body. There are a variety of endocrine conditions that are characterized by either hormonal hyposecretion or hypersecretion. Percutaneous selective

venous sampling is the gold standard diagnostic tool for the medical and surgical management of patients with a variety of such disorders Selective venous sampling is a minimally invasive interventional procedure that interventional radiologists perform to localize sites of abnormal hormone secretion Computed tomography and magnetic resonance imaging are the most used diagnostic imaging modalities in patients with the suspected endocrine disorder however their specificity is not optimal and identifying a culprit gland is difficult based on imaging findings alone Therefore the ultimate decision for management depends on the outcome of selective venous sampling As these various venous samplings are increasingly performed worldwide the collaboration between interventional radiology endocrinology surgical endocrinology surgical oncology neurosurgery and gynecology teams is essential With limited literature on the topic this volume fills the gap with in depth coverage of selective venous sampling alongside the pathophysiology epidemiology clinical diagnosis as well as medical surgical and interventional management of endocrine disorders The book is divided into five parts Clinical Laboratory and Radiological Diagnosis of Endocrine Disorders Selective Venous Sampling in Interventional Radiology Medical Treatment of Endocrine Disorders Surgical Treatment of Endocrine Disorders Interventional Treatment of Endocrine Disorders Throughout these parts endocrine disorders that require venous sampling are covered in depth primary aldosteronism primary hyperparathyroidism Cushing s disease hormone secreting pancreatic adenomas and androgen secreting ovarian tumors There is additionally an emerging role for interventional management in thyroid gland disorders which is covered here This is an ideal guide for interventional radiologists caring for patients with endocrine disorders as well as endocrinologists endocrine surgeons surgical oncologists otolaryngologists neurosurgeons gynecologists and nephrologists Advances in Craniopharyngioma: From Physiology to Clinical Management Songbai Gui,Edward Raymond Laws,Paolo Cappabianca,2023-03-16 *Endocrinology in Anaesthesia and Surgery* G. Some idea of the frequency of thyroid carcinoma is given by its incidence in the United States. Every year some 26 000 patients are diagnosed there as suffering from thyroid cancer. Comparable figures apply to most countries in Europe although the incidence does vary somewhat from country to country perhaps depending on the endogenous iodine intake. Of the 21 000 patients diagnosed annually in the United States two thirds will be women and some 800 will die of the disease during the year. This book should do much to improve the outcome in the treatment of thyroid cancer. First because it is written by a small team of experts of international repute. Secondly their wide experience of the condition allows them to write with authority and thirdly they express their views in
