

## Skin Cancer & Sunscreen

### Skin Cancer:

Ever since 2012, skin cancer has been the most common cancer in the U.S. Approximately 2 million people are diagnosed annually with skin cancer. There are more cases of skin cancer diagnosed than lung, colon, breast, and prostate cancer combined. This means that approximately 1 in 5 people will be diagnosed with skin cancer in their lifetime.

The number one risk factor for skin cancer is UV radiation exposure. The most common source of UV radiation is sunlight. In fact, most people have experienced more than 50% of the recommended lifetime UV dose by the time they are 20 years old.

UV radiation exposure can also occur in tanning devices. In fact, a single use of a tanning device increases the chance of developing skin cancer by 20%. According to the American Cancer Society, those who begin indoor tanning before the age of 35 have an 87% increase in their risk of developing melanoma.

Other risk factors besides UV radiation exposure that increase risk of skin cancer include having fair skin, getting one or more severe sunburns, living in a sunny environment, moles, skin lesions, family history, compromised immune system, radiation exposure, and/or chemical exposure.

### Types of Skin Cancer:

Skin cancer is most simply abnormal growth of epithelial cells and is most commonly found in areas of skin with high sun exposure. UV radiation causes mutations in the DNA of skin cells, and when these mutations occur in parts of the DNA that control cell growth, uncontrolled cell growth occurs.
