Steiner Trees In Industries:

Steiner Trees in Industry Xiuzhen Cheng, Ding-Zhu Du, 2001-10-31 This book is a collection of articles studying various Steiner tree problems with applications in industries such as the design of electronic circuits computer networking telecommunication and perfect phylogeny The Steiner tree problem was initiated in the Euclidean plane Given a set of points in the Euclidean plane the shortest network interconnecting the points in the set is called the Steiner minimum tree The Steiner minimum tree may contain some vertices which are not the given points Those vertices are called Steiner points while the given points are called terminals The shortest network for three terminals was first studied by Fermat 1601 1665 Fermat proposed the problem of finding a point to minimize the total distance from it to three terminals in the Euclidean plane The direct generalization is to find a point to minimize the total distance from it to n terminals which is still called the Fermat problem today The Steiner minimum tree problem is an indirect generalization Schreiber in 1986 found that this generalization i.e. the Steiner minimum tree was first proposed by Gauss

Algorithmics of Large and Complex Networks Jürgen Lerner, Dorothea Wagner, Katharina Zweig, 2009-06-29 Networks play a central role in today's society since many sectors employing information technology such as communication mobility and transport even social interactions and political activities are based on and rely on networks In these times of globalization and the current global financial crisis with its complex and nearly incomprehensible entanglements of various structures and its huge effect on seemingly unrelated institutions and organizations the need to understand large networks their complex structures and the processes governing them is becoming more and more important This state of the art survey reports on the progress made in selected areas of this important and growing field thus helping to analyze existing large and complex networks and to design new and more efficient algorithms for solving various problems on these networks since many of them have become so large and complex that classical algorithms are not sufficient anymore This volume emerged from a research program funded by the German Research

Foundation DFG consisting of projects focusing on the design of new discrete algorithms for large and complex networks The 18 papers included in the volume present the results of projects realized within the program and survey related work They have been grouped into four parts network algorithms traffic networks communication networks and network analysis and simulation Handbook of Combinatorial Optimization Ding-Zhu Du, Panos M. Pardalos, 2006-08-18 Combinatorial or discrete optimization is one of the most active fields in the interface of operations research computer science and applied mathematics Combinatorial optimization problems arise in various applications including communications network design VLSI design machine vision a line crew scheduling corporate planning computer aided design and manufacturing database query design cellular telephone frequency assignment constraint directed reasoning and computational biology Furthermore combinatorial optimization problems occur in many diverse areas such as linear and integer programming graph theory artificial intelligence and number theory All these problems when formulated mathematically as the minimization or maximization of a certain function defined on some domain have a commonality of discreteness Historically combinatorial optimization starts with linear programming Linear programming has an entire range of important applications including production planning and distribution personnel assignment finance allocation of economic resources circuit simulation and control systems Leonid Kantorovich and Tjalling Koopmans received the Nobel Prize 1975 for their work on the optimal allocation of resources Two important discoveries the ellipsoid method 1979 and interior point approaches 1984 both provide polynomial time algorithms for linear programming These algorithms have had a profound effect in combinatorial optimization Many polynomial time solvable combinatorial optimization problems are special cases of linear programming e.g. matching and maximum flow In addition linear programming relaxations are often the basis for many approximation algorithms for solving NP hard problems e.g. dual heuristics

Computational Mathematics Driven by Industrial Problems R. Burkard, P. Deufhard, A. Jameson, J.-L. Lions, G. Strang, 2007-05-06 These lecture notes by very authoritative scientists survey recent advances of mathematics driven by industrial application showing not only how mathematics is applied to industry but also how mathematics has drawn benefit from interaction with real world problems The famous David Report underlines that innovative high technology depends crucially for its development on innovation in mathematics The speakers include three recent presidents of ECMI one of ECCOMAS in Europe and the president of SIAM

Optimal Interconnection Trees in the Plane Marcus Brazil, Martin Zachariasen, 2015-04-13 This book explores fundamental aspects of geometric network optimisation with applications to a variety of real world problems It presents for the first time in the literature a cohesive mathematical framework within which the properties of such optimal interconnection networks can be understood across a wide range of metrics and cost functions The book makes use of this mathematical theory to develop efficient algorithms for constructing such networks with an emphasis on exact solutions Marcus Brazil and Martin Zachariasen focus principally on the geometric structure of optimal interconnection networks also known as Steiner trees in the plane They show readers how

an understanding of this structure can lead to practical exact algorithms for constructing such trees The book also details numerous breakthroughs in this area over the past 20 years features clearly written proofs and is supported by 135 colour and 15 black and white figures It will help graduate students working mathematicians engineers and computer scientists to understand the principles required for designing interconnection networks in the plane that are as cost efficient as possible
