Stereotyped Movements Brain And Behavior Relationships:

Stereotyped Movements ,2009 Stereotyped movements or stereotypy is a term used to describe physical movements that are both aimless and repetitive These behaviors cover a wide range of movements from the steady rhythmic body rocking of some developmentally disabled patients to the abrupt transient movements of people with Tourette s syndrome These movements often inhibit the physical and social functioning of patients and interfere with their care Although noted in clinical observations for centuries there is not yet a coherent theoretical or empirical understanding of these repetitive actions The editors of this volume propose that these seemingly disparate conditions in patients with various physical and psychiatric disorders are actually conceptually related This volume marks the beginning of researchers efforts to integrate the field of stereotyped movements and provides an important bridge between behavioral and biomedical approaches

Applications of Nonlinear Dynamics To Developmental Process Modeling Karl M. Newell, Peter C.M. Molenaar, 2014-03-05 There has been an increasing interest in the application of dynamical systems to the study of development over the last decade The explosion of the dynamical systems framework in the physical and biological sciences has opened the door to a new Zeitgeist for studying development This appeal to dynamical systems by developmentalists is natural given the intuitive links between the established fundamental problems of development and the conceptual and operational scope of nonlinear dynamical systems This promise of a new approach and framework within which to study development has led to some progress in recent years but also a growing appreciation of the difficulty of both fully examining the new metaphor and realizing its potential Divided into 4 parts this book is a result of a recent conference on dynamical systems and development held at Pennsylvania State University The first 3 parts focus on the content domains of development that have given most theoretical and empirical attention to the potential applications of dynamical systems physical growth and movement cognition and communication These parts show that a range of nonlinear models have been applied to a host of developmental phenomena Part 4 highlights two particular methodological issues that hold important implications for the modeling of developmental phenomena with dynamical systems techniques
