Temperature And Environmental Effects On The Testis:

Temperature and Environmental Effects on the Testis Adrian W. Zornio, 2013-03-13 It must be considered that there is nothing more difficult to carry out nor more doubtful of success nor more dangerous to handle than to initiate a new order of things Machiavelli The Prince 1513 These are the Proceedings of a Conference on Temperature and Environmental Factors and the Testis which took place at New York University School of Medicine December 8th and 9th 1989 There is good reason to believe that this was the first of its kind to address exclusively the implications of temperature for this highly thermosensitive organ and its precious genetic cargo The organizers of the Conference hoped to stimulate interest in this area which paradoxically has a considerable literature but which has received scant attention and sometimes outright opposition from clinicians expert in male infertility There have been studies of the relationship of temperature to reproduction starting in the mid 18th Century with observations of the relationship of water temperature to spawning of fish There is also a vast literature on the deleterious effects of externally applied heat upon spermatogenesis but little study of the possibility that intrinsic heat may be an important etiologic factor in subfertile semen Today fertility research has largely ignored this in favor of research in areas which have not produced successes in terms of live births comparable to what can be obtained by varicocelectomy when appropriate or scrotal hypothermia viz 1 Concentration upon the endocrine aspects of testicular function and its relation to spermatogenesis

Normal Testicular Descent and the Aetiology of Cryptorchidism John M. Hutson, Masaru Terada, Baiyun Zhou, Martyn P.L. Testis cancer: genes, environment, hormones Alberto Ferlin, Carlo Foresta, 2015-10-29 Testicular cancer TC is the most common cancer in males aged 20 40 years with a worldwide incidence of 7.5 per 100 000 but the rates vary considerably between countries and ethnic groups and there is evidence also for an increasing incidence in last decades About 95% of all TCs are represented by testicular germ cell tumors TGCTs which include seminoma and non seminoma histological types It is generally assumed that the development of TGCT is under endocrine control In particular unbalanced androgen estrogen levels and or activity are believed to represent the key events for TGCT development and progression Furthermore recent evidence has suggested genetic association of TGCT with variations in genes involved in hypothalamic pituitary testicular axis and steroidogenic enzymes This recent evidence expands the current knowledge on the role of genetic contribution in testicular cancer susceptibility and supports the hypothesis that variations in hormone metabolism genes might change the hormonal environment implicated in testicular carcinogenesis Therefore hormonal carcinogenesis is an important and controversial area of current research in TGCT and further attention is given to genetic factors influencing hormone related cancer risk The genetic component to TGCT is in general strong In fact although environmental factors clearly contribute to TGCT development and probably to its increasing incidence in some geographical areas the proportion of TGCT susceptibility accounted for by the genetic effects is estimated at 25% TGCT has high familial risks compared with most other cancer types that are generally no more than two fold brothers of individuals with TGCT have an 8 to 12 fold increased risk of disease and sons of affected individuals have a 4 to 6 fold increased risk Despite this strong familial relative risk early results from linkage studies identified a limited relationship with genetic factors suggesting that TGCT is a genetically complex trait However more recently four genome wide association studies GWAS from the UK and USA have reported association of TGCTs with six new loci KITLG SPRY4 BAK1 DMRT1 TERT and ATF7IP The strongest association for TGCT susceptibility was found for SNPs in KITLG ligand for the membrane bound receptor tyrosine kinase KIT gene with a greater than 2.5 fold increased risk of disease per major allele which is the highest reported for any cancer to date These studies are being now replicated by other researches and attention is given to the relationship between these genetic variations TGCT risk and frequently associated anomalies of the reproductive tract such as cryptorchidism and infertility Finally over the past few decades TCGT research has focused also on external environmental causes acting mainly as endocrine disruptors of androgen and oestrogen pathways even during the foetal development of the testis It is well known that the testicular dysgenesis syndrome TDS hypothesis proposed ten years ago suggests that disturbed testicular development in fetal life may result in one or more of four disorders postnatally named cryptorchidism hypospadias poor semen quality and TGCT These four disorders are therefore considered as one clinical entity and are linked together by epidemiological and

pathophysiological relations The relative contribution of genetics and environment in TGCT development and the interactions between endocrine disruptors and variations in genes involved in hormonal carcinogenesis is therefore another interesting area of research **Veterinary Andrology and Artificial Insemination** Mr. Rohit Manglik,2024-03-03 EduGorilla
