Steel H Piles:

Steel H Piles Bethlehem Steel Corporation, 2015-06-24 Excerpt from Steel H Piles The use of steel bearing piles made from structural shapes started about 1899 although the use of metal piles both cast iron and wrought iron dates back over 85 years The earliest steel piles were in the form of I beams and fabricated sections made from plates and angles These steel bearing piles were used first in the Middle Western States in what proved to be a successful effort to meet the serious problem caused by the undermining of bridge piers and abutments on pile foundations in compact gravel and sand These soil conditions limited the depth to which piles other than steel could be driven It was demonstrated that steel piles could withstand extremely hard driving and could penetrate to depths safely below the scouring action of streams The steel piles also solved another serious problem by providing the necessary resistance to damage from ice floes A typical instance of such a condition was the difficulty in providing safe and substantial bridge crossings along the Platte River in Nebraska This river is wide but shallow and has an extensive drainage area Because of these characteristics early spring thaws cause ice floes to develop out of all proportion to the discharge capacity of the stream At such times flooding of the river opens new channels by a violent scouring action which in many cases undermines the bridge structures The only salvation for such structures was the development of foundation piles capable of being driven well below the possible scour level In this instance I beams and fabricated steel piles provided the only solution After 1908 when Bethlehem Steel rolled the first steel H column section in this country the H section rapidly became recognized as ideally suited for use as piling The early use of steel piles primarily as a means of combatting stream scour and resisting attacks from floating ice also demonstrated that greater loads could safely be carried by the deep driven steel piles than by other types of piles Tests proved that with sufficient penetration in deep beds of sand or gravel the bearing capacity of a steel H pile could be taken to be its strength as a column with a length measured from the region of estimated maximum scour to the top of the pile The high bearing value of the steel H pile permitted its use with initial economy in addition to providing long term economy by affording ample security against scour and ice The originally used I beams and fabricated sections driven deep into the ground provided sturdy foundations but the Bethlehem wide flange H sections solved the problem even more satisfactorily The success of steel H piles was immediate and the use of the older types of steel piles was soon abandoned By 1932 several thousand bridges stood on steel H pile foundations in the territory between the Continental Divide and the Mississippi River In this area there is complete diversity of soil and climatic conditions About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at www.forgottenbooks.com This book is a reproduction of an important historical work Forgotten Books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy In rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition We do however repair the vast majority of imperfections successfully any imperfections that
