Regulatory Mechanisms in Breast Cancer Marc E. Lippman, Robert B. Dickson, 2012-12-06 In Breast Cancer Cellular and Molecular Biology Kluwer Academic Publishers 1988 we tried to present an introduction to the emerging basic studies on steroid receptors oncogenes and growth factors in the regulation of normal and malignant mammary epithelium The response to this volume was superb indicating a tremendous interest in basic growth regulatory mechanisms governing breast cancer and controlling its malignant progression In the two years since its publication much new and exciting information has been published and the full interplay of regulatory mechanisms is now beginning to emerge We have divided this book into four sections that we hope will unify important concepts and help to crystallize areas of consensus and or disagreement among a diverse group of basic and clinical scientists working on the disease The first section is devoted to studies on oncogenes antioncogenes proliferation and tumor prognosis The first chapter by Sunderland and McGuire introduces the characteristics of breast cancer as studied by pathologists to establish prognostic outcome Of particular interest is a new proto oncogene called HER 2 or neu which is rapidly becoming accepted as a valuable new tumor marker of poor prognosis The second chapter by Lee Bookstein and Lee introduces the best known antioncogene the retinoblastoma antioncogene whose expression is sometimes lost in breast cancer Malignant progression appears to be influenced by the balance of proto oncogene and antioncogene expression

Progress in Heritable Soft Connective Tissue Diseases Jaroslava Halper, 2021-11-22 This volume represents a substantially revised and updated 2nd edition of a reference handbook on major structural components of soft connective tissues and a whole slew of heritable diseases of soft connective tissues The number of clearly identifiable and distinct disorders has grown somewhat since the 1st edition in 2014 e g Ehlers Danlos syndrome has now 13 entities A brand new syndrome Meester Loeys syndrome carrying the name of Bart Loeys was added as a companion to Loeys Dietz syndrome Numerous variations of cutis laxa and joint mobility disorders have been discovered taking advantage of recent advancements in genetic analysis We have acquired better understanding of pathogenesis and biochemical changes in some other more established entities such as Marfan and collagen VI myopathies where better management and possible treatment are on the horizon Even in the case of connective tissue diseases in domestic animals some progress has been made All these updates were contributed by a group of distinguished and preeminent physicians and scientists all of them not just working in the field but making new discoveries described by them Readers will notice that seemingly there is an overlap among many of these disorders And indeed many of them if not most are interconnected

because of the prominent roles of TGF of fibrillin microfibrils and collagen fibril assembly and other molecules playing in connective tissues physiology and by extension in pathogenesis of many disorders described in the book What I found particularly helpful that author s of each chapter bring their own perspective even when described closely related mechanism of the disease These observations should help with diagnosis and management of such cases The first chapters are more general concentrating more on the physiology structure and biochemistry of normal soft tissues That should help in better understanding of the pathophysiology Last but not least the chapters are very readable more like detective stories than dry description of genetic biochemical defects I do hope that basic scientists and clinicians with similar and diverse interests alike will appreciate this volume and will be inspired by it to develop their research in the field

Novel Diagnostic and Therapeutic Strategies in the Management of Cerebral Gliomas Valeria Barresi,Maria Caffo,Giuseppe Lombardi,Letteria Minutoli,Emeline Tabouret ,Herui Wang,2024-10-29 Cerebral gliomas account for 45% of all primary central nervous system CNS tumors The median survival after the initial diagnosis of glioblastoma GBM is only 15 months and less than 10% of patients survive three years post diagnosis Surgical treatment followed by adjuvant therapies such as radiotherapy and chemotherapy represents the classical strategy in glioma management The revised WHO 2016 classification now distinguishes the oligodendrogliomas with 1p19q codeletion and IDH mutation from the astrocytomas with or without IDH mutations thereby creating homogenous and pathologically distinct subgroups While the status of gene expression and mutations define components of GBM subtypes it was also found that response to therapies was different for each subtype suggesting that personalized treatment based on genomic alterations could lead to a more favorable outcome for this disease
