

Physiology of Bone

- Bone is a special form of connective tissue.
- It is well vascularized with total blood flow of 200–400 mL/min in adult humans.
- The ends of each long bone (**epiphyses**) are separated from the shaft of the bone by a plate of actively proliferating cartilage, the **epiphyseal plate**.
- Linear bone growth can occur as long as the epiphyses are separated from the shaft of the bone, but such growth ceases after the epiphyses unite with the shaft (**epiphyseal closure**).
