Boilermakers' Journal ,1915 **Pattern Recognition Using Neural and Functional Networks** Vasantha Kalyani David,S. Rajasekaran,2008-11-20 Biologically inspired computing is different from conventional computing. It has a different feel often the terminology does not sound like it is talking about machines. The activities of this computing sound more human than mechanistic as people speak of machines that behave, react, self-organize, learn, generalize, remember, and even to forget. Much of this technology tries to mimic nature's approach in order to mimic some of nature's capabilities. They have a rigorous mathematical basis and neural networks, for example, have a statistically valid set on which the network is trained.

Two outlines are suggested as the possible tracks for pattern recognition. They are neural networks and functional networks. Neural networks, many interconnected elements operating in parallel, carry out tasks that are not only beyond the scope of conventional processing but also cannot be understood in the same terms. Imaging applications for neural networks seem to be a natural fit. Neural networks love to do pattern recognition. A new approach to pattern recognition using microARTMAP together with wavelet transforms in the context of hand-written characters, gestures, and signatures have been dealt. The Kohonen Network, Back Propagation Networks, and Competitive Hopfield Neural Network have been considered for various applications. Functional networks being a generalized form of Neural Networks where functions are learned rather than weights is compared with Multiple Regression Analysis for some applications and the results are seen to be coincident. New kinds of intelligence can be added to machines and we will have the possibility of learning more about learning. Thus our imaginations and options are being stretched. These new machines will be fault-tolerant, intelligent, and self-programming, thus trying to make the machines smarter. So as to make those who use the techniques even smarter.

Chapter 1 is a brief introduction to Neural and Functional networks in the context of Pattern recognition using these disciplines. Chapter 2 gives a review of the architectures relevant to the investigation and the development of these technologies in the past few decades. Retracted VIII Preface. Chapter 3 begins with the look at the recognition of handwritten alphabets using the algorithm for ordered list of boundary pixels as well as the Kohonen Self-Organizing Map (SOM). Chapter 4 describes the architecture of the MicroARTMAP and its capability.

Toth, Joseph O'Rourke, Jacob E. Goodman, 2017-11-22. The Handbook of Discrete and Computational Geometry is intended as a reference book fully accessible to nonspecialists as well as specialists covering all major aspects of both fields. The book offers the most important results and methods in discrete and computational geometry to those who use them in their work both in the academic world as researchers in mathematics and computer science and in the professional world as practitioners in fields as diverse as operations research, molecular biology,

and robotics Discrete geometry has contributed significantly to the growth of discrete mathematics in recent years This has been fueled partly by the advent of powerful computers and by the recent explosion of activity in the relatively young field of computational geometry This synthesis between discrete and computational geometry lies at the heart of this Handbook A growing list of application fields includes combinatorial optimization computer aided design computer graphics crystallography data analysis error correcting codes geographic information systems motion planning operations research pattern recognition robotics solid modeling and tomography
