Taste & Smell

Taste & smell

Most of our special senses are chemoreception systems: gustation (taste) and olfaction (smell). The degree to which we can respond to taste or olfaction, thereby and smell, depends on the number of receptors we possess. The sense of taste is less discriminatory than the sense of smell, and there is an overlap between taste receptors. The sense of smell is highly discriminatory, with several types of olfactory receptors, each responding to particular odors. Taste and olfaction are related to smell, vision and hearing, important with the sense of touch, but taste is particularly affected by the sense of smell.

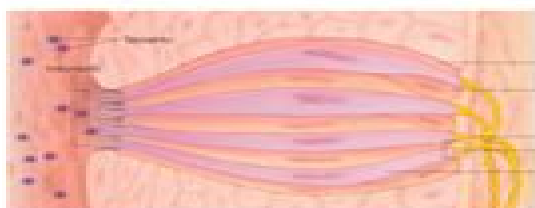

Concentrations

Taste receptors vary depending on the concentration of molecules of a substance in a given volume of liquid. For low concentrations, taste is not as salty, sweet, sour, or bitter as it is at higher concentrations.

Gustation

Gustation, the sense of taste, gives us information about the food and drink that we consume. Taste buds on the primary gustatory organ, the tongue, contain chemoreceptors called gustatory cells. These taste buds have four basic components: sweet, sour, salty, and bitter. A fifth taste, umami, is also present. The tongue is covered with papillae, or small bumps, which contain taste buds.

The taste bud

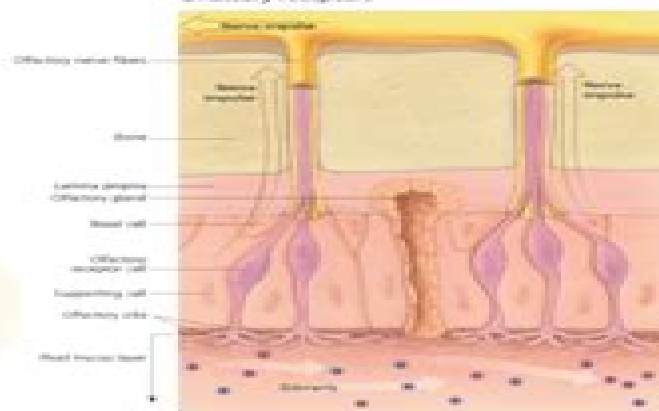

Each taste bud contains gustatory cells, which have microvilli that project into the oral cavity. The resulting receptor potential travels to the base of the gustatory cell, where the signal is transmitted to the brain via the gustatory nerve. The taste buds are located on the tongue, and they are replaced by new cells generated from basal cells at the base of the taste buds.

Olfaction

The sense of smell is called olfaction, or the detection of odors. Olfaction depends on specialized chemical receptors, or chemoreceptors, located within the olfactory epithelium. These receptors are designed to respond to small amounts of an odorant, a molecule that can be smelled. The brain integrates the input from several different receptors to identify a particular odor. Humans can detect about 10,000 odors.

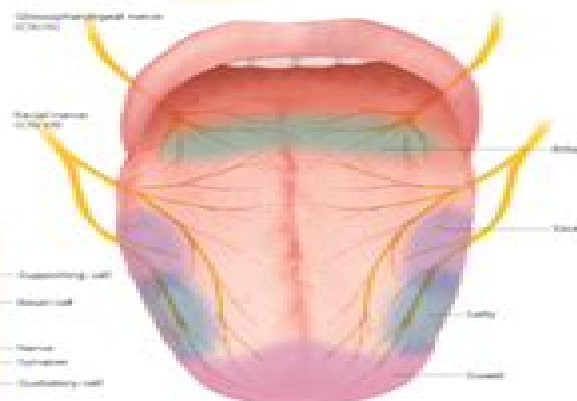

As air flows through the nose, the odors across the nasal cavity, passing through the olfactory epithelium. Odorant molecules can interact with the olfactory neurons, leading to the ability to detect odors by increasing the release of an impulse, which can activate the neurons of the brain.

Olfactory receptors

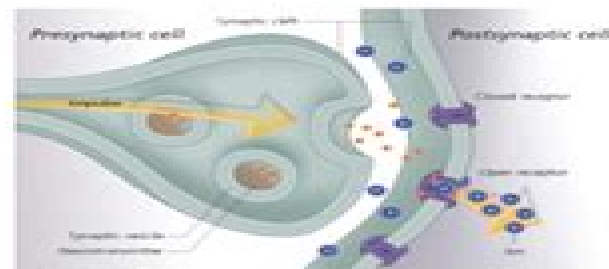

Olfactory receptors

Olfactory receptors are located in the olfactory epithelium, where they detect odorant molecules in the olfactory bulb. The olfactory bulb is a specialized structure that is located in the brain. It is the olfactory bulb that sends the signal to the brain via the olfactory nerve. Unlike other senses, the olfactory neurons are connected directly to the cerebral cortex, rather than through the thalamus in the brain.

Compound sweet and salty tastes, we are 100 times more sensitive to taste compounds than we are to smell. This is because a compound taste, such as sweet, can be detected by several different receptors, while a single taste, such as salty, can only be detected by one receptor. This is why we are 100 times more sensitive to taste than we are to smell.

The synapse

Neurons communicate with other cells at a synapse, the site of a nerve impulse transmission. The space between the presynaptic, or sending, neuron and the postsynaptic, or receiving, cell is called the synaptic cleft. An impulse enters at the tip of the axon, the terminal button, where "messenger" molecules called neurotransmitters. These highly specialized chemicals carry nerve impulses from the presynaptic cell to the postsynaptic cell. The impulse enters the cell, where it is released into the synaptic cleft, where it can bind to the postsynaptic cell, where it is released into the synaptic cleft, where it can bind to the postsynaptic cell.

Taste and Smell Doug Kincaid, Peter Sephton Coles, 1983 Introduces the senses of taste and smell and explains how some things are good to taste while others are not and how smells can tell us about things and warn us of danger *Head and Neck* Enrico Marani, Ciska Heida, 2018-11-02 This book offers a critical review of the head and neck from an anatomical physiological and clinical perspective It begins by providing essential anatomical and physiological information then discusses historical and current views on specific aspects in subsequent chapters For example the anatomy of the skull cap or cranial vault provided in the first chapter is discussed in the context of malformation and identity as well as the development of the bony skull in the following chapters These chapters provide stepping stones to guide readers through the book There are new fields of research and technological developments in which Anatomy and Physiology lose track of progress One of the examples discussed is the automated face recognition In some respects e g when it comes to cancers and

malformations our understanding of the head and neck and the resulting therapeutic outcomes have been extremely disappointing In others such as injuries following car accidents there have been significant advances in our understanding of head and neck dysfunctions and their treatment Therefore head movements also during sleep and head and neck reflexes are discussed The book makes unequivocal distinctions between correct and incorrect assumptions and provides a critical review of alternative clinical methods for head and neck dysfunctions such as physiotherapy and lymphatic drainage for cancers Moreover it discusses the consequences of various therapeutic measures for physiological and biomechanical conditions as well as puberty and aging Lastly it addresses important biomedical engineering developments for hearing e g cochlear implants and for applying vestibular cerebellar effects for vision
