The Brightest Binaries:

The Brightest Binaries D. Vanbeveren, W. van Rensbergen, C. de Loore, 2001-11-30 The evolution of galaxies is governed mainly by the evolution of massive stars whereas the evolution of a massive star depends primarily on its mass chemical composition and on whether or not the star is a Single object or a binary component To study the evolution of galaxies it is therefore essential to know how stellar masses are distributed at birth how many stars are formed in binaries and what the mass ratio and orbital period distribution of binaries look like Massive stars are intrinsically the brightest stars so that it may be possible to discover their properties in distant groups prOvided that large telescopes can be used for basic stellar observations However until now the observations of massive stars have been reasonably complete only for a small region of our own Galaxy 3 kpc from the Sun One hopes that the conclusions resulting from these observations hold for the whole Galaxy for the whole cosmos With The Brightest Stars of De Jager 1980 in mind the present monograph is an addendum and an update in which we discuss the observations of The Brightest Binaries in the framework of stellar evolution A small or intermediate mass star close to the Sun may look brighter than a massive one far away However within volume limited star samples the massive stars are on average also the brightest ones In the present monograph similarly as in the work of De Jager bright means massive The book consists of four main chapters **The Brightest Binaries** D.

Vanbeveren, 2013-06-29 A star in a binary may interact with its companion and this complicates significantly its structure and evolution During several decades in the past many astronomers hoped that the number of binaries is small This is sometimes reflected in theoretical studies dealing with large populations of stars where it is ASSUMED without any justification that binaries do not alter the

results The number of confirmed binaries increases as observations improve and we therefore thought that the time was right to organize a meeting where the main topic would be the effect of binaries on stellar population studies The SOC proposed a program with extended general overviews and highlights of non evolved and evolved binaries with low mass intermediate mass and massive components the link with supernova explosions pulsars and gamma ray bursts the effect of binaries on the chemical evolution of galaxies Specialists in the different research fields were invited and have given very interesting and highly educational talks As can be noticed by reading the proceedings the authors have put a lot of effort in preparing their contribution

Zdenek Kopal's Binary Star Legacy Horst Drechsel, Miloslav Zejda, 2005-08-01 An international conference entitled Zdenek Kopal's Binary Star Legacy was held on the occasion of the late Professor Kopal's 90th birthday in his home town of Litomyšl Czech Republic and dedicated to the memory of one of the leading astronomers of the 20th century Professor Kopal who devoted 60 years of his scientific life to the exploration of close binary systems initiated a breakthrough in this field with his description of binary components as non spherical stars deformed by gravity with surfaces following Roche equipotentials Such knowledge triggered the development of new branches of astrophysics dealing with the structure and evolution of close binaries and the interaction effects displayed by exciting objects such as cataclysmic variables symbiotic stars or X ray binaries Contributions to this conference included praise of the achievements of a great astronomer and personal reminiscences brought forward by Kopal's former students and colleagues and reflected the state of the art of the dynamically evolving field of binary research which owes so much to the pioneering work of Zdenek Kopal

A Guide to Close Binary Systems Edwin Budding, Osman Demircan, 2022-05-12 Introduction to Close Binary Systems provides a comprehensive survey and guide to the fast moving field of multiple specifically binary stars with an up to date account of research around close i.e. interacting pairs Such interactions allow direct quantification of stellar properties opening up factual insights into basic building blocks of the Universe The book provides a much needed update for the seminal Close Binary Systems of Zdenek Kopal Following a comparable plan it presents relevant subject matter with an emphasis on building a framework of understanding to serve as a supporting resource for students and researchers The text starts from a general historical background and progresses into the main theoretical ideas supporting our prima facie interpretation of observations The central chapters explore further into these observational methods arranged according to the classic subdivisions of astrometry spectroscopy and photometry Optimal inversion of observational data into model parametrization is a theme through these chapters Significant here is the problem of how non uniqueness in modelling affects interpretation The underlying issues of stellar evolution bearing on observational evidence become paramount in the last four chapters The book proceeds step by step from directly understandable examples of unevolved pairs to the challenging cases where stars are found in more and more extreme conditions leading up to the mergers of massive black hole pairs seen in the new field of gravitational wave astronomy This is a valuable reference for postgraduate and advanced

undergraduate students working in mainstream areas of stellar astrophysics with applications also to exoplanet research which shares some methodological features Course designers for stellar astrophysics will find a useful selection of topics within this book Key features Provides a well explained and backgrounded up to date account of close binary systems in a fast moving field of research that is growing in scientific importance Surveys a wide range of case studies within the context of binary and multiple star systems Fills an acknowledged gap in current literature Cover Image A public memorial to Zdenek Kopal in his home town birthplace of Litomysl in Czechia

Universe DK,2020-09-08 Marvel at the wonders of the universe from stars and planets to black holes and nebulae in this exploration of our solar system and beyond Universe opens with a look at astronomy and the history of the Universe using 3D artworks to provide a comprehensive grounding in the fundamental concepts of astronomy including the basic techniques of practical astronomy The core of the book is a tour of the cosmos covering the Solar System the Milky Way and galaxies beyond our own Explanatory pages introduce different celestial phenomena such as galaxies and are followed by catalogs that profile the most interesting and important examples A comprehensive star atlas completes the picture with entries on each of the 88 constellations and a monthly sky guide showing the night sky as it appears throughout the year as viewed from both the northern and southern hemispheres

The Importance of Binaries in the Formation and Evolution of Planetary Nebulae Henri M. J. Boffin,David Jones,2019-09-04 It is now clear that a binary evolutionary pathway is responsible for a significant fraction of all planetary nebulae with some authors even going so far as to claim that binarity may be a near requirement for the formation of an observable nebula This has led to the requirement that textbooks most likely need to be rewritten Building upon the review of Jones and Boffin in Nature Astronomy 2017 this Springer Brief takes a first step in this direction It offers the first expanded presentation of all the theoretical and observational support for the importance of binarity in the formation of planetary nebulae initially focusing on common envelope evolution but also covering wider binaries This book emphasises the wider impact of the field highlighting the critical role binary central stars of planetary nebulae have in understanding a plethora of astrophysical phenomena including type Ia supernovae chemically peculiar stars and circumbinary exoplanets

The Brightest Stars C. de Jager,2012-12-06 No part of the Hertzsprung Russell diagram shows a more pronounced diversity of stellar types than the upper part which contains the most luminous stars Can one visualize a larger difference than between a luminous young and extremely hot Of star and a cool evolved pulsating giant of the Mira type or an S type supergiant or again at the other side of the diagram the compact nucleus of a planetary nebula But there is order and unity in this apparent disorder Virtually all types of bright stars are evolutionally related in one way or the other Evolution links bright stars In many cases the evolution is speeded up by or at least intimately related to various signs of stellar instability Bright stars lose mass either continuously or in dramatic sudden events they vibrate or pulsate and with these tenuous gigantic objects this often happens in a most bizarre fashion Sometimes the evolution goes so fast that fundamental changes are observable in the time span of a human s

C. Lazaro, M.J. Arevalo, 2008-01-11 More than half of all stars in the universe formed and evolved as binary systems and their study is essential for understanding stellar and galactic evolution The six lectures in this book give both a readable introduction and an up to date review of nearly all aspects of research into binary stars including the range from common binaries to more exotic systems composed of white dwarfs neutron stars and black holes
