Dynamical Systems VII V.I. Arnol'd, S.P. Novikov, 2013-12-14 A collection of five surveys on dynamical systems indispensable for graduate students and researchers in mathematics and theoretical physics Written in the modern language of differential geometry the book covers all the new differential geometric and Lie algebraic methods currently used in the theory of integrable systems

Automorphic Forms on SL2 (R) Armand Borel, 1997-08-28 An introduction to the analytic theory of automorphic forms in the case of fuchsian groups

Lie Groups Wulf Rossmann, 2006 Lie Groups is intended as an introduction to the theory of Lie groups and their representations at the advanced undergraduate or beginning graduate level It covers the essentials of the subject starting from basic undergraduate mathematics The correspondence between linear Lie groups and Lie algebras is developed in its local and global aspects The classical groups are analysed in detail first with elementary matrix methods then with the help of the structural tools typical of the theory of semisimple groups such as Cartan subgroups roots weights and reflections The fundamental groups of the classical groups are worked out as an application of these methods Manifolds are introduced when needed in connection with homogeneous spaces and the elements of differential and integral calculus on manifolds are presented with special emphasis on integration on groups and homogeneous spaces Representation theory starts from first principles such as Schur's lemma and its consequences and proceeds from there to the Peter Weyl theorem Weyl's character formula and the Borel-Weil theorem all in the context of linear groups

SL2(R) S. Lang, 2012-12-06 SL2 R gives the student an introduction to the infinite dimensional representation theory of semisimple Lie groups by concentrating on one example SL2 R This field is of interest not only for its own sake but for its connections with other areas such as number theory as brought out for example in the work of Langlands The rapid development of representation theory over the past 40 years has made it increasingly difficult for a student to enter the field This book makes the theory accessible to a wide audience its only prerequisites being a knowledge of real analysis and some differential equations

Geometry Of Mobius Transformations: Elliptic, Parabolic And Hyperbolic Actions Of $SL_2(r)$ (With Dvd-rom) Vladimir V Kisil,2012-06-19 This book is a unique exposition of rich and inspiring geometries associated with M bius transformations of the hypercomplex plane The presentation is self contained and based on the structural properties of the group $SL_2 R$ Starting from elementary facts in group theory the author unveils surprising new results about the geometry of circles parabolas and hyperbolas using an approach based on the Erlangen programme of F Klein who defined geometry as a study of invariants under a transitive group action The treatment of elliptic parabolic and hyperbolic M bius transformations is provided in a uniform way This is possible due to an appropriate usage of complex dual and double numbers which represent all non isomorphic commutative associative two dimensional algebras with unit The hypercomplex numbers are in perfect correspondence with the three types of geometries concerned Furthermore connections with the physics of Minkowski and Galilean space time are considered a **Dynamical Systems and Random Processes** Jane Hawkins,Rachel L. Wiseman,2019-09-23 This volume contains the proceedings of the 16th Carolina Dynamics Symposium held from April 13 15 2018 at Agnes Scott College Decatur Georgia The papers cover various topics in dynamics and randomness including complex dynamics ergodic theory topological dynamics celestial mechanics symbolic dynamics computational topology random processes and regular languages The intent is to provide a glimpse of the richness of the field and of the common threads that tie the different specialties together Modern Geometry— Methods and Applications B.A. Dubrovin,A.T. Fomenko,S.P. Novikov,1985-08-05 Up until recently Riemannian geometry and basic topology were not included even by departments or faculties of mathematics as compulsory subjects in a university level mathematical education The standard courses in the classical differential geometry of curves and surfaces which were given instead and still are given in some places have come gradually to be viewed as anachronisms However there has been hitherto no unanimous agreement as to exactly how such courses should be brought up to date that is to say which parts of modern geometry should be regarded as absolutely essential to a modern mathematical education and what might be the appropriate level of abstractness of their exposition The task of designing a modernized course in geometry was begun in 1971 in the mechanics division of the Faculty of Mechanics and Mathematics of Moscow State University The subject matter and level of abstractness of its exposition were dictated by the view that in addition to the geometry of curves and surfaces the following topics are certainly useful in the various areas of application of mathematics especially in elasticity and relativity to name but two and are

therefore essential the theory of tensors including covariant differentiation of them Riemannian curvature geodesics and the calculus of variations including the conservation laws and Hamiltonian formalism the particular case of skew symmetric tensors i e *Partially Hyperbolic Dynamics, Laminations, and Teichmuller Flow* Giovanni Forni, This volume collects a set of contributions by participants of the Workshop Partially hyperbolic dynamics laminations and Teichmuller flow held at the Fields Institute in Toronto in January 2006 The Workshop brought together several leading experts in two very active fields of contemporary dynamical systems theory partially hyperbolic dynamics and Teichmuller dynamics They are unified by ideas coming from the theory of laminations and foliations dynamical hyperbolicity and ergodic theory These are the main themes of the current volume The volume contains both surveys and research papers on non uniform and partial hyperbolicity on dominated splitting and beyond in Part I Teichmuller dynamics with applications to interval exchange transformations and on the topology of moduli spaces of quadratic differentials in Part II foliations and laminations and other miscellaneous papers in Part III Taken together these papers provide a snapshot of the state of the art in some of the most active topics at the crossroads between dynamical systems smooth ergodic theory geometry and topology suitable for advanced graduate students and researchers Non specialists will find the extensive in depth surveys especially useful Representation of Lie Groups and Special Functions Naum IĀkovlevich Vilenkin, A. U. Klimyk, 1991-11-30 This is the first of three major volumes which present a comprehensive treatment of the theory of the main classes of special functions from the point of view of the theory of group representations This volume deals with the properties of classical orthogonal polynomials and special functions which are related to representations of groups of matrices of second order and of groups of triangular matrices of third order This material forms the basis of many results concerning classical special functions such as Bessel MacDonald Hankel Whittaker hypergeometric and confluent hypergeometric functions and different classes of orthogonal polynomials including those having a discrete variable Many new results are given The volume is self contained since an introductory section presents basic required material from algebra topology functional analysis and group theory For research mathematicians physicists and engineers Handbook of Dynamical Systems A. Katok, B. Hasselblatt, 2005-12-17 This second half of Volume 1 of this Handbook follows Volume 1A which was published in 2002 The contents of these two tightly integrated parts taken together come close to a realization of the program formulated in the introductory survey Principal Structures of Volume 1A The present volume contains surveys on subjects in four areas of dynamical systems Hyperbolic dynamics parabolic dynamics ergodic theory and infinite dimensional dynamical systems partial differential equations Written by experts in the field The coverage of ergodic theory in these two parts of Volume 1 is considerably more broad and thorough than that provided in other existing sources The final cluster of chapters discusses partial differential equations from the point of view of dynamical systems **Special Functions and the Theory of Group Representations** Naum IĀkovlevich Vilenkin, 1978 *Algebraic Transformation Groups and Algebraic Varieties* Vladimir Leonidovich

Popov,2004-04-01 The book covers topics in the theory of algebraic transformation groups and algebraic varieties which are very much at the frontier of mathematical research Invariant Probabilities of Transition Functions Radu

Zaharopol,2014-06-27 The structure of the set of all the invariant probabilities and the structure of various types of individual invariant probabilities of a transition function are two topics of significant interest in the theory of transition functions and are studied in this book The results obtained are useful in ergodic theory and the theory of dynamical systems which in turn can be applied in various other areas like number theory They are illustrated using transition functions defined by flows semiflows and one parameter convolution semigroups of probability measures In this book all results on transition probabilities that have been published by the author between 2004 and 2008 are extended to transition functions The proofs of the results obtained are new For transition functions that satisfy very general conditions the book describes an ergodic decomposition that provides relevant information on the structure of the corresponding set of invariant probabilities Ergodic decomposition means a splitting of the state space where the invariant ergodic probability measures play a significant role Other topics covered include characterizations of the supports of various types of invariant probability measures and the use of these to obtain criteria for unique ergodicity and the proofs of two mean ergodic theorems for a certain type of transition functions The book will be of interest to mathematicians working in ergodic theory dynamical systems or the theory of Markov processes Biologists physicists and economists interested in interacting particle systems and rigorous mathematics will also find this book a valuable resource Parts of it are suitable for advanced graduate courses Prerequisites are basic notions and results on functional analysis general topology measure theory the Bochner integral and some of its applications

Connes, C. Consani, B. I.

Dundas, M. Khalkhali, H. Moscovici,2023-02-23 This volume contains the proceedings of the virtual conference on Cyclic Cohomology at 40 Achievements and Future Prospects held from September 27 October 1 2021 and hosted by the Fields

Institute for Research in Mathematical Sciences Toronto ON Canada Cyclic cohomology since its discovery forty years ago in noncommutative differential geometry has become a fundamental mathematical tool with applications in domains as diverse as analysis algebraic K theory algebraic geometry arithmetic geometry solid state physics and quantum field theory The reader will find survey articles providing a user friendly introduction to applications of cyclic cohomology in such areas as higher categorical algebra Hopf algebra symmetries de Rham Witt complex quantum physics etc in which cyclic homology plays the role of a unifying theme The researcher will find frontier research articles in which the cyclic theory provides a computational tool of great relevance In particular in analysis cyclic cohomology index formulas capture the higher invariants of manifolds where the group symmetries are extended to Hopf algebra actions and where Lie algebra cohomology is greatly extended to the cyclic cohomology of Hopf algebras which becomes the natural receptacle for characteristic classes In algebraic topology the cyclotomic structure obtained using the cyclic subgroups of the circle action on topological Hochschild homology gives rise to remarkably significant arithmetic structures intimately related to crystalline cohomology through the de Rham Witt complex Fontaine's theory and the Fargues Fontaine curve
