Alkene Polymerization Reactions with Transition Metal Catalysts Yury Kissin, 2008-03-10 During the past 30 years the

field of alkene polymerization over transition metal catalysts underwent several major changes 1 The list of commercial heterogeneous Ziegler Natta catalysts for the synthesis of polyethylene and stereoregular polyolefins was completely renewed affording an unprecedented degree of control over the polymer structure 2 Research devoted to metallocene and other soluble transition metal catalysis has vastly expanded and has shifted toward complexes of transition metals with multidentate ligands 3 Recent developments in gel permeation chromatography temperature rising fractionation and crystallization fractionation provided the first reliable information about differences between various active centers in transition metal catalysts 4 A rapid development of high resolution ^{13}C NMR spectroscopy resulted in greatly expanded understanding of the chemical and steric features of polyolefins and alkene copolymers These developments require a new review of all aspects of alkene polymerization reactions with transition metal catalysts The first chapter in the book is an introductory text for researchers who are entering the field It describes the basic principles of polymerization reactions with transition metal catalysts the types of catalysts and commercially manufactured polyolefins The next chapter addresses the principal issue of alkene polymerization catalysis the existence of catalyst systems with single and multiple types of active centers The subsequent chapters are devoted to chemistry and stereochemistry of elemental reaction steps structures of catalyst precursors and reactions leading to the formation of active centers kinetics of polymerization reactions and their mechanisms The book describes the latest commercial polymerization catalysts for the synthesis of polyethylenes and polypropylene The book provides a detailed description of the multi center nature of commercial Ziegler Natta catalysts The book devotes specialized chapters to the most important aspects of transition metal polymerization catalysts the reactions leading to the formation of active centers the chemistry and stereochemistry of elemental polymerization steps reaction kinetics and the polymerization mechanism The book contains an introductory chapter for researchers who are entering the field of polymerization catalysis It describes the basic principles of polymerization reactions with transition metal catalysts and the types of commercially manufactured polyolefins and copolymers The book contains over 2000 references the most recent up to end of 2006

Metal-Catalysed Reactions of Hydrocarbons Geoffrey C. Bond, 2006-10-03 This unique book drawing on the author's lifetime experience critically evaluates the extensive literature on the field of Metal Catalysed Reactions of Hydrocarbons Emphasis is placed on reaction mechanisms involving hydrogenation hydrogenolysis skeletal and positional isomerisation and exchange reactions The motivation for fundamental research in heterogeneous catalysis is to identify the physicochemical characteristics of active centres for the reaction being studied to learn how these may be modified or manipulated to improve the desired behavior of the catalyst and to recognize and control those aspects of the catalyst's structure that limit its overall performance By restricting the subject of the book to hydrocarbons Bond has progressively developed the subject matter to include areas of importance both to researchers and to those working in the industry

Homogeneous Catalysis with Metal Phosphine Complexes Louis M. Pignolet, 2013-11-21 The field of

transition metal catalysis has experienced incredible growth during the past decade. The reasons for this are obvious when one considers the world's energy problems and the need for new and less energy demanding syntheses of important chemicals. Heterogeneous catalysis has played a major industrial role; however, such reactions are generally not selective and are exceedingly difficult to study. Homogeneous catalysis suffers from on-site engineering difficulties; however, such reactions usually provide the desired selectivity. For example, Monsanto's synthesis of optically active amino acids employs a chiral homogeneous rhodium diphosphine catalyst. Industrial uses of homogeneous catalyst systems are increasing. It is not by accident that many homogeneous catalysts contain tertiary phosphine ligands. These ligands possess the correct steric and electronic properties that are necessary for catalytic reactivity and selectivity. This point will be emphasized throughout the book. Thus, the stage is set for a comprehensive treatment of the many ways in which phosphine catalyst systems can be designed, synthesized, and studied.

Stereochemistry of Coordination Compounds Alexander von Zelewsky, 1996-06-03. This well-illustrated and well-referenced book provides a systematic introduction to the modern aspects of the topographical stereochemistry of coordination compounds, which are made up of metal ions surrounded by other non-metal atoms, ions, and molecules.

Catalysis and Surface Properties of Liquid Metals and Alloys Keizo Ogino, 2020-09-29. This book presents up-to-date information about the catalysis and surface properties of liquid metals and liquid alloys. It is intended for use by chemical engineers and researchers in catalysis, surface science, liquid metals, and chemical process technologies.

Organic Reactions Stereochemistry And Mechanism (Through Solved Problems) P. S. Kalsi, 2007. The book provides a self-study of different topics of organic chemistry via problem-solving. The present 4th edition has been completely rewritten according to the organic chemistry syllabus of the Net CSIR examination. This necessitated the deletion of several topics from the third edition and incorporation of new ones. Emphasis has been laid on a variety of new reactions, name reactions, reagents in organic synthesis, and incorporation of their knowledge in the entire coverage of organic chemistry in a unique way. A thorough study of the book is expected to help the student to excel not only in the university examination including the Net examination but also in his learning of various topics and before interview boards. Several topics like aromaticity, pericyclic reactions, and heterocyclic chemistry have now been brought up-to-date, and the material provided is complete in itself. The presentation has been so designed so as to thread through the entire organic chemistry by the application of the knowledge learnt in one topic to newer situations in other topics. The present revised edition also includes numerous important developments since the third edition of the book was published.

Molecular Heterogeneous Catalysis Rutger A. van Santen, Matthew Neurock, 2009-06-10. An integrated approach to the molecular theory of reaction mechanism in heterogeneous catalysis, largely based on the knowledge among the growing theoretical catalysis community over the past half century and covering all major catalytic systems. The authors develop a general conceptual framework including in-depth comparisons with enzyme

catalysis biomineralisation organometallic and coordination chemistry A chapter dedicated to molecular electrocatalysis addresses the molecular description of reactions at the liquid solid interphase while studies range from a quantum chemical treatment of individual molecular states to dynamic Monte Carlo simulations including the full flexibility of the many particle systems Complexity in catalysis is explained in chapters on self organization and self assembly of catalysts and other sections are devoted to evolutionary combinatorial techniques as well as artificial chemistry
