Katholieke Universiteit Leuven regularly runs a course on the state of the art and evolution of computer security and industrial cryptography. The first course took place in 1983, the second in 1989, and since then the course has been a biennial event. The course is intended for both researchers and practitioners from industry and government. It covers the basic principles as well as the most recent developments. Our own interests mean that the course emphasizes cryptography, but we also ensure that the most important topics in computer security are covered. We try to strike a good balance between basic theory and real life applications, between mathematical background and judicial aspects, and between recent technical developments and standardization issues. Perhaps the greatest strength of the course is the creation of an environment that enables dialogue between people from diverse professions and backgrounds. In 1993 we published the formal proceedings of the course in the Lecture Notes in Computer Science series, Volume 741. Since the field of cryptography has advanced considerably during the interim period, there is a clear need to publish a new edition. Since 1993, several excellent textbooks and handbooks on cryptology have been published, and the need for introductory level papers has decreased. The growth of the main conferences in cryptology, Eurocrypt, Crypto, and Asiacrypt, shows that interest in the field is increasing.

Jurgensen, 2008 Computers are complex tools of the human species To make them work well for us we have to specify their
actions in very great detail When properly instructed networks of computers take on the trappings of human social orders
derived from the physiological characteristics and capabilities of our species To create a social order we engage in grouping

mechanisms through which the actions of the individuals within the group are influenced From a technical perspective such grouping mechanisms form the trust environments within which we can effect policy Historically the most comprehensive such environments have been formed by religions Within a specific religion the policy framework is established by a statement of theology So if we connect all the dots when we want to tell our computers how to act in a manner paralleling human social orders we must define for them a theology So goes the rationale explored in great detail by the authors of Computer Theology Based on their combined tenure of almost a century working in the realms of computer systems and their ubiquitous networks du Castel and Jurgensen have expressed both social and computer systems through the same concepts The result offers a unique perspective on the interconnection between people and machines that we have come to understand as the World Wide Web
