**Mental Health** Teresa L. Scheid, Eric R. Wright, 2017-06-08 The third edition of A Handbook for the Study of Mental Health presents a comprehensive review of the sociology of mental health Emotional Impulsivity and Emotion Regulation Deficits as Important Factors in Clinically Challenging Behaviors in Psychiatric Disorders Matthew J. Hoptman, Melissa Cyders, Anthony O. Ahmed, 2025-04-16 Impulsivity typically refers to rash action without forethought It has a number of dimensions including delayed discounting attentional impulsivity motor impulsivity sensation seeking and nonplanning impulsivity In the neurocognitive domain considerable work has focused on response inhibition In general impulsivity has been related to numerous psychiatric symptoms and has been shown to be elevated in many disorders Emotion had been explicitly decoupled from impulsivity in many of the most commonly used measures such as the Barratt Impulsiveness Scale In part this was done in the interest of understanding impulsivity as a pure construct However in a meta analysis of the most commonly used impulsivity scales Whiteside and Lynam 2001 urgency emerged as an important construct This study led to the development of the Urgency Lack of Premeditation Lack of Persistence and Sensation Seeking scale UPPS Urgency refers to rash action in the context of strong emotion or mood It has been shown to have an important role in numerous psychiatric disorders ranging from depression to schizophrenia to substance abuse Berg 2015 Pearlstein et al 2023 More recent work has examined the consequences of elevated urgency for behavior

**Preventing Suicide in Patients with Mental Disorders** Maurizio Pompili, Andrea Fiorillo, 2020-12-07 Suicide is a complex phenomenon that is now considered understood as a neurodevelopmental condition encompassing childhood experiences as well as proximal conditions such as mental disorders and adverse life events Individuals in crisis may face overwhelming psychological pain which in some cases may overcome the threshold of each unique individual for whom suicide is considered the best option to deal with such pain However many socio demographic personal or temperamental variables have been investigated for their causal association with suicide risk but to date no single factor has clearly demonstrated an association with suicide The mental disorders most frequently associated with suicide risk include bipolar disorders and major unipolar depression substance use disorders and schizophrenia However anxiety personality eating and trauma related disorders as well as organic mental disorders also contribute to suicidal risk Moreover in modern society the presence of social uncertainty the changes in family models the development of social media and the loss of face to face interaction can have an impact on suicide risk particularly in the younger generation

**Preventive Strategies on Suicide** Diekstra, Gulbinat, Kienhorst, Leo, 2023-07-31 Recent estimates by The World Health Organisation and The World Bank indicate that throughout the world each and every year more than 800 000 persons die as a consequence of suicide This means that the death toll of suicide equals and in many countries even exceeds that of road traffic accidents In addition to the number of suicidal deaths at least ten times as many persons make non fatal attempts to take their lives or harm themselves often seriously enough to require medical attention and not infrequently resulting in irreversible disability But still these figures inadequately describe the magnitude of human loss and

suffering caused by suicide If one assumes that for every suicidal death there are at least five persons whose lives are profoundly and often for many years affected by the event emotionally socially and economically by the event then each year millions of survivor victims are added to the tens of millions already out there Hence suicide is an ever recurring catastrophe of the first degree It is not a phenomenon that first and foremost forms a dubious privilege of the so called highly developed countries Suicide also occurs in the developing countries and there is more than suggestive evidence that in several of these countries the suicide rate equals or even surpasses the highest national rates shown by official statistics It follows that suicide is an extremely important public health problem It is however a problem that is painfully neglected Throughout the world resources devoted to the prevention of suicide are only a tiny fraction of those devoted to the prevention of comparable problems such as road traffic accidents or to problems of lesser magnitude at least in the industrialized countries such as HIV infection and Aids This volume produced under the supervision and auspices of the World Health Organization brings together for the first time information on epidemiological clinical and preventive intervention aspects regarding suicide that have global significance and applicability After a detailed description of the epidemiology of suicide and suicidal behaviour on an international scale a large part of the book is devoted to the how to s of developing and organizing suicide prevention programs and services in different national and cultural settings both at clinical and community level In addition a wealth of practical information for health care workers and volunteers is provided on how to evaluate and deal with acute suicide risk Examples of successful preventive intervention programs and projects from the developed as well as the developing world are provided Legal and ethical problems involved in suicide prevention are also discussed Finally both cultural and biological aspects of suicidal behaviour as well as their clinical practice relevance are examined

William T. O'Donohue, Lorraine T. Benuto, Lauren Woodward Tolle, 2014-07-08 Adolescence is a pivotal period of development with respect to health and illness. It is during adolescence that many positive health behaviors are consolidated and important health risk behaviors are first evident; thus, adolescence is a logical time period for primary prevention. In addition, the predominant causes of morbidity and mortality in adolescence are quite different from those of adults, indicating that early identification and treatment of adolescent health problems must be directed to a unique set of targets in this age group. Moreover, because of the particular developmental issues that characterize adolescence, intervention efforts designed for adults are often inappropriate or ineffective in an adolescent population. Even when chronic illnesses are congenital or begin in childhood, the manner in which the transition from childhood to adolescence to young adulthood is negotiated has important implications for disease outcomes throughout the remainder of the person's life span. Organized in five major sections: General Issues, Developmental Issues, Treatment and Training, Mental Health, and Physical Health, and 44 chapters, *Handbook of Adolescent Health Psychology* addresses the common and not so common health issues that tend to affect adolescents. Coverage includes Context and perspectives in adolescent health psychology; Health literacy; health maintenance and disease prevention in adolescence; Physical disorders such as asthma, obesity, physical injury, and chronic pain; Psychological disorders such as substance abuse, attention deficit hyperactivity disorder, depression, and eating disorders; Congenital chronic diseases such as type 1 diabetes and spina bifida. *Handbook of Adolescent Health Psychology* is the definitive reference for pediatricians, family physicians, health psychologists, clinical social workers, rehabilitation specialists, and all practitioners and researchers working with adolescents.
