Stratigraphic Boundary Problems: Permian and Triassic of West Pakistan Curt Teichert, 1970 **Stratigraphic boundary problems: Permian and Triassic of West Pakistan**, ed by B. Kummel and C. Teichert Bernhard Kummel, Curt Teichert, *Permian-Triassic Evolution of Tethys and Western Circum-Pacific* Yin Yin Hongfu, J.M. Dickins, G.R. Shi, Tong Tong Jinnan, 2000-05-10 Permian and Triassic are the interval known for the integration and separation of Pangea the closure of the Palaeotethys and the opening of Mesotethys They were associated with a series of worldwide events including the Late Palaeozoic glaciation and succeeding extensive evaporitic and reef formations the end Palaeozoic regression strong orogenies and widespread volcanism and magmatism and finally the Permo Triassic biotic macro extinction These events resulted in the formation of enormous reserves of coal petroleum evaporites phosphorites and metal resources The Permian and Triassic thus constitutes a time interval particularly important both for understanding the Earth's history and for exploration of mineral resources The book aims to reconstruct the Permian Triassic history of Pangea Palaeo Tethys and Palaeo Pacific through stratigraphic palaeogeographic and other interdisciplinary approaches It consists of two parts Part 1 deals with regional stratigraphy of Tethyan and western Circum Pacific countries which is the basis for interregional correlation and palaeogeography Part 2 deals with the biotic evolution at the Permian Triassic transition focusing on the major invertebrate groups foraminifers radiolarians brachiopods ammonoids and conodonts Permo-Triassic Events in the Eastern Tethys Walter C. Sweet, Yang Zunyi, J. M. Dickins, 2003-12-04 This book describes and interprets Upper Permian and Lower Triassic rocks and their fossils in the region of the eastern Tethys bringing together information gathered in the International Geological Correlation Programme Project 203 *Plants and Palynomorphs around the Permian-Triassic Boundary of South China* Jianxin Yu, Jean Broutin, Zongsheng Lu, 2022-08-08 This book documents timely and systematically marvelous fossils plants and sporopollen related to the biggest mass extinction of the Permian Triassic transition Numerous beautiful pictures and comprehensive records on the plants of this unique and critical interval of geohistory are presented in this book It greatly contributes to understanding of the Permian Triassic plant diversity and evolution For geologists it is important to understand the Permian Triassic crisis and for students it is attractive to learn about the plants response to palaeoclimatic changes **Tectonics of the Western Himalayas** Lawrence L. addresses the principles and methods for determining petroleum source rocks based on fossil spores and pollen. Studying petroliferous basins in China we discovered that there are often as many as three different sources of the microfossils: the source rocks, the rocks along the pathway and the reservoir rocks. Therefore fossil spores, pollen and algae from inland and coastal shelf petroliferous basins are analyzed and illustrated to show this complex process. Furthermore the organic origin theory of oil is proven and environmental characteristics for hydrocarbon source rock formation are discussed. Along with the geochronical and geographic distribution of non marine petroleum source rocks in China the mechanisms of petroleum migration following the pathways to the reservoirs are investigated. It will be a valuable reference work as well as a textbook for a wider research areas ranging from stratigraphy, palynology, palaeontology and petroleum geology. A. K. Ghosh

Fossils and Strata is an international series of monographs and memoirs in palaeontology and biostratigraphy owned by and published on behalf of The Lethaia Foundation in cooperation between the Scandinavian countries. Fossils and Strata forms part of the same structured publishing programme as the international journal Lethaia and provides a complementary outlet for more comprehensive systematic and regional monographs including taxonomic descriptions. Fossils and Strata also offers the publication of thematic special issues comprising a series of shorter contributions.

The Permian of Northern Pangea Peter A. Scholle, Tadeusz M. Peryt, Dana S. Ulmer-Scholle, 2012-12-06

The Permian was a remarkable time period. It represents the maximum stage of Pangean continental assembly, includes a major global climatic shift from glacial to nonglacial conditions, icehouse greenhouse transition and is terminated by one of the most profound faunal/floral extinction events in the Earth's history. In addition, Permian oceans, although poorly understood, must have had some quite unique characteristics. Permian seas reached the most extreme values of carbon/sulfur and strontium isotopic ratios ever achieved in Phanerozoic time and the isotopic ratios of all three elements abruptly returned to more normal values at or very close to the Permian-Triassic boundary. Finally, the Permian is marked by an abundance of important sedimentary mineral resources. It has large fossil fuel concentrations, coal, oil and natural gas, enormous phosphate reserves and very extensive evaporite deposits including gypsum, anhydrite and halite as well as a variety of potash salts. Study of the Permian has been hampered, however, by a number of factors. These include a scattered geologic literature presented in a variety of languages, a confusing regional and global stratigraphic

framework based in part on inadequate type sections and largely provincial often poorly correlatable faunas All have contributed to the sparsity and inadequacy of overviews of this critical geological interval The two volumes attempts to bring together some of the widely scattered observations about these fascinating rocks at least for the northern pre dominantly nonglacial parts of Pangea **Catalog of Copyright Entries.
