The development of adequate, sufficiently general models for text–dominated databases is a sticky problem, and one that is far from solved. With the increased use of corpora for their research, computational linguists have been forced in recent years to grapple with the organization of and access to large text databases, usually by developing application-specific, ad hoc systems barely grounded in database theory. The advent of digital libraries and the prospect of distributed research environments has generated more interest in the development of application-independent text database models, but few, if any, directly address the needs of corpus linguistics and natural language processing research.

The work Doedens describes in this book is motivated by the need to accommodate the data in the Electronic Concordance Application (ECA) at the Vrije Universiteit Amsterdam. The data comprise the Hebrew Bible, together with annotation for morphology, part of speech, and syntactic structure. Consequently, although the text model and query languages he describes are generalizable to other texts, they were developed to directly address the representation and retrieval needs for linguistic data. The discussion and examples are therefore particularly relevant and accessible to computational linguists.

In Chapter 2, Doedens outlines the properties of enriched text—such as hierarchical organization, recursively nested structures, variants and alternatives, and discontinuities—that make traditional database models (e.g., relational models) inadequate for their representation. He also describes the need for user access to different "views" of a text (e.g., as physical structure, logical structure, linguistic structure, etc.), a particularly thorny retrieval problem. The discussion could be more detailed, and it could be usefully generalized to other types of richly encoded text beyond those containing linguistic annotation. Nonetheless, this is one of the few places these special properties have been described and considered in developing text database models. The author provides a useful list of "basic demands" for text database models, and uses them to evaluate four previously developed models (two of them developed at the University of Waterloo, as an outgrowth of the *New OED* project). He gives cursory treatment to SGML as a text database model; given its increasingly widespread use, a more thorough discussion—especially of its weaknesses—would be valuable.

Chapter 3 outlines the Monads dot Feature (MdF) model for text databases, and Chapter 4 describes its implementation in the ECA database. The model itself seems
