Neuroendocrinology of Aging Joseph Meites, 2012-12-06 JOSEPH MEITES The idea that the endocrine system is involved in aging processes is as old as the beginnings of endocrinology The first endocrine experiment related to aging was reported by Brown Sequard who is usually regarded as the father of

endocrinology In 1889 at the age of 72 years he reported that he had succeeded in rejuvenating himself by injections of testicular extracts from dogs and guinea pigs Although the favorable effects observed may have been due mainly to the powers of auto suggestion his reports created a considerable interest in endocrinology and its relation to aging and eventually led to the use of estrogens for treating certain pre and postmenopausal symptoms in women and androgens for treating some symptoms in aging men Up to about the 1960 s the relatively few studies on endocrine aging relationships dealt mainly with changes in weight and histological appearance of endocrine organs in aging animals and human subjects and included a limited number of measurements of endocrine function by bioassays and chemical procedures for steroids Within these limitations gerontological investigators were unable to establish any definite relationships between endocrine functions and aging processes with the exception of the connection between reproductive decline and gonadal and pituitary activity [Current Catalog](#) National Library of Medicine (U.S.), First multi year cumulation covers six years 1965 70
