ABSTRACT: Multilayer materials consisting of ceramic and glass/epoxy composites have been subjected to high strain rate compression testing using the Split Hopkinson Pressure Bar. The samples were extensively strain gaged so that dynamic data were generated directly from the samples during testing. Output data from the experiments were compared with numerical simulations of the same experiments and good agreement was noted. It was found that the stress distribution within samples was quite inhomogeneous and that stresses were highest in the region of the bar-sample interface. The presence of a rubber interlayer between the ceramic and glass/epoxy decreased the stress in both components but dramatically increased the degree of stress inhomogeneity.

KEY WORDS: multilayer structures, finite element analysis, mechanical properties, high strain rate.

INTRODUCTION

MECHANICAL TESTING OF conventional metallic materials at high strain rates is a relatively mature technical undertaking. Typical equipment includes the Split Hopkinson Pressure Bar (SHPB), flyer plate tests, and so forth. However, an increasing number of newer materials are being considered for applications where high strain rates are encountered and testing of these is more problematical. For example, many polymers

Strength Of Materials Mr. Keshavaraj Girinivas,Dr. Shankar H. Sanni,2024-07-27 Strength of Materials is a foundational the behavior of solid objects under various types of loading such as tension compression bending and torsion It provides comprehensive coverage of core principles including stress strain and material properties with practical applications in engineering and design The book integrates theory with problem solving techniques making it an essential guide for engineering students and professionals who need to understand material strength to predict failure points and ensure structural integrity Through detailed examples and explanations it bridges theoretical knowledge and real world engineering applications

Stress Waves in Non-Elastic Solids W. K. Nowacki,2018-03-06 Stress Waves in Non Elastic Solids is a comprehensive presentation of the principles underlying the propagation of stress waves in non elastic solids with emphasis on wave problems in the theory of plasticity This book exposes wave propagation problems for a range of material responses and justifies the hypotheses introduced in specialized theories and the simplifications made in the analysis of particular problems Both analytical and numerical methods of solving problems are described and a large number of solutions to specific problems of wave propagation in inelastic solids are given This book is comprised of six chapters and begins with an overview of the fundamental equations of the dynamics of inelastic media The dynamical properties of metals

and soils are discussed offering an account of the most representative theories of plasticity and viscoplasticity. The next chapter considers the basic definitions of discontinuity surfaces and the conditions that must be satisfied across these surfaces. Certain mathematical fundamentals are given referring to systems of differential equations quasi linear and semi linear of the first order. Initial and boundary value problems for hyperbolic equations are also formulated. The remaining chapters focus on methods of solving stress wave propagation problems including one dimensional plane waves and longitudinal transverse waves. Wave propagation problems for elastic plastic and elastic viscoplastic media are treated in detail along with the most important problem of shock waves in metals and soils. The last chapter deals with thermal wave propagation problems. This monograph will be a valuable resource for students and practitioners of engineering physics and mathematics.
