In 1991-1993 our three volume book Representation of Lie Groups and Special Functions was published When we started to write that book in 1983 editors of Kluwer Academic Publishers expressed their wish for the book to be of encyclopaedic type on the subject Interrelations between representations of Lie groups and special functions are very wide This width can be explained by existence of different types of Lie groups and by richness of the theory of their representations This is why the book mentioned above spread to three big volumes Influence of representations of Lie groups and Lie algebras upon the theory of special functions is lasting This theory is developing further and methods of the representation theory are of great importance in this development When the book Representation of Lie Groups and Special Functions vol 1-3 was under preparation new directions of the theory of special functions connected with group representations appeared New important results were discovered in the traditional directions This impelled us to write a continuation of our three volume book on relationship between representations and special functions The result of our further work is the present book The three volume book published before was devoted mainly to studying classical special functions and orthogonal polynomials by means of matrix elements Clebsch Gordan and Racah coefficients of group representations and to generalizations of classical special functions that were dictated by matrix elements of representations

Applications of Hypergroups and Related Measure Algebras ,1995-02-28 The most important single thing about this conference was that it brought together for the first time representatives of all major groups of users of hypergroups They talked to each other about how they were using hypergroups in fields as diverse as special functions probability theory representation theory measure algebras Hopf

algebras and Hecke algebras This led to fireworks from the Introduction Hypergroups occur in a wide variety of contexts and mathematicians the world over have been discovering this same mathematical structure hidden in very different applications The diverse viewpoints on the subject have led to the need for a common perspective if not a common theory Presenting the proceedings of a Joint Summer Research Conference held in Seattle in the summer of 1993 this book will serve as a valuable starting point and reference tool for the wide range of users of hypergroups and make it easier for an even larger audience to use these structures in their work *Algorithmic and Computer Methods for Three-Manifolds* A.T. is dedicated to the theory of continuous selections of multi valued mappings a classical area of mathematics as far as the formulation of its fundamental problems and methods of solutions are concerned as well as J n area which has been intensively developing in recent decades and has found various applications in general topology theory of absolute retracts and infinite dimensional manifolds geometric topology fixed point theory functional and convex analysis game theory mathematical economics and other branches of modern mathematics The fundamental results in this the ory were laid down in the mid 1950 s by E Michael The book consists of relatively independent three parts Part A Theory Part B Results and Part C Applications We shall refer to these parts simply by their names The target audience for the first part are students of mathematics in their senior year or in their first year of graduate school who wish to get familiar with the foundations of this theory The goal of the second part is to give a comprehensive survey of the existing results on continuous selections of multivalued mappings It is intended for specialists in this area as well as for those who have mastered the material of the first part of the book In the third part we present important examples of applications of continuous selections We have chosen examples which are sufficiently interesting and have played in some sense key role in the corresponding areas of mathematics **Complete Minimal Surfaces of Finite Total Curvature** Kichoon Yang,2013-03-09 This monograph

contains an exposition of the theory of minimal surfaces in Euclidean space with an emphasis on complete minimal surfaces of finite total curvature Our exposition is based upon the philosophy that the study of finite total curvature complete minimal

surfaces in R^3 in large measure coincides with the study of meromorphic functions and linear series on compact Riemann surfaces. This philosophy is first indicated in the fundamental theorem of Chern and Osserman: A complete minimal surface M immersed in R^3 is of finite total curvature if and only if M with its induced conformal structure is conformally equivalent to a compact Riemann surface M_g punctured at a finite set E of points and the tangential Gauss map extends to a holomorphic map $M_g \rightarrow P^2$. Thus a finite total curvature complete minimal surface in R^3 gives rise to a plane algebraic curve. Let M_g denote a fixed but otherwise arbitrary compact Riemann surface of genus g . A positive integer r is called a puncture number for M_g if M_g can be conformally immersed into R^3 as a complete finite total curvature minimal surface with exactly r punctures. The set of all puncture numbers for M_g is denoted by $P(M_g)$. For example, Jorge and Meeks [JM] showed by constructing an example g for each r that every positive integer r is a puncture number for the Riemann surface p_l .

Introduction to Geometry of Manifolds with Symmetry V.V. Trofimov, 2013-04-17

One of the most important features of the development of physical and mathematical sciences in the beginning of the 20th century was the demolition of prevailing views of the three dimensional Euclidean space as the only possible mathematical description of real physical space. Apriorization of geometrical notions and identification of physical 3 space with its mathematical model R^3 were characteristic for these views. The discovery of non Euclidean geometries led mathematicians to the understanding that Euclidean geometry is nothing more than one of many logically admissible geometrical systems. Relativity theory amended our understanding of the problem of space by amalgamating space and time into an integral four dimensional manifold. One of the most important problems lying at the crossroad of natural sciences and philosophy is the problem of the structure of the world as a whole. There are a lot of possibilities for the topology of four dimensional space time and at first sight a lot of possibilities arise in cosmology. In principle not only can the global topology of the universe be complicated but also smaller scale topological structures can be very nontrivial. One can imagine two usual spaces connected with a throat making the topology of the union complicated.

Orthogonal Polynomials Paul Nevai, 2012-12-06

This volume contains the Proceedings of the NATO Advanced Study Institute on Orthogonal Polynomials and Their Applications held at The Ohio State University in Columbus Ohio U S A between May 22 1989 and June 3 1989. The Advanced Study Institute primarily concentrated on those aspects of the theory and practice of orthogonal polynomials which surfaced in the past decade when the theory of orthogonal polynomials started to experience an unparalleled growth. This progress started with Richard Askey's Regional Conference Lectures on Orthogonal Polynomials and Special Functions in 1975 and subsequent discoveries led to a substantial reevaluation of one's perceptions as to the nature of orthogonal polynomials and their applicability. The recent popularity of orthogonal polynomials is only partially due to Louis de Branges's solution of the Bieberbach conjecture which uses an inequality of Askey and Gasper on Jacobi polynomials. The main reason lies in their wide applicability in areas such as Padé approximations, continued fractions, Tauberian theorems, numerical analysis, probability theory, mathematical statistics,

scattering theory nuclear physics solid state physics digital signal processing electrical engineering theoretical chemistry and so forth This was emphasized and convincingly demonstrated during the presentations by both the principal speakers and the invited special lecturers The main subjects of our Advanced Study Institute included complex orthogonal polynomials signal processing the recursion method combinatorial interpretations of orthogonal polynomials computational problems potential theory Pade approximations Julia sets special functions quantum groups weighted approximations orthogonal polynomials associated with rootsystems matrix orthogonal polynomials operator theory and group representations **Representation**

Theory and Harmonic Analysis Ray Alden Kunze, 1995 This volume stems from a special session on representation theory and harmonic analysis held in honour of Ray Kunze at the 889th meeting of the American Mathematical Society on January 12 15 1994 It is intended for graduate students and research mathematicians interested in topological groups lie groups and abstract harmonic analysis **Classical Orthogonal Polynomials of a Discrete Variable** Arnold F. Nikiforov, Sergei K.

Suslov, Vasilii B. Uvarov, 2012-12-06 While classical orthogonal polynomials appear as solutions to hypergeometric differential equations those of a discrete variable emerge as solutions of difference equations of hypergeometric type on lattices The authors present a concise introduction to this theory presenting at the same time methods of solving a large class of difference equations They apply the theory to various problems in scientific computing probability queuing theory coding and information compression The book is an expanded and revised version of the first edition published in Russian Nauka 1985 Students and scientists will find a useful textbook in numerical analysis **New Developments in Differential Geometry**

Szenthe, 2012-12-06 Proceedings of the Colloquium on Differential Geometry Debrecen Hungary July 26 30 1994 **Hamiltonian Mechanical Systems and Geometric Quantization** Mircea Puta, 2012-12-06 This volume presents various aspects of the geometry of symplectic and Poisson manifolds and applications in Hamiltonian mechanics and geometric quantization are indicated Chapter 1 presents some general facts about symplectic vector space symplectic manifolds and symplectic reduction Chapter 2 deals with the study of Hamiltonian mechanics Chapter 3 considers some standard facts concerning Lie groups and algebras which lead to the theory of momentum mappings and the Marsden Weinstein reduction Chapters 4 and 5 consider the theory and the stability of equilibrium solutions of Hamilton Poisson mechanical systems Chapters 6 and 7 are devoted to the theory of geometric quantization This leads in Chapter 8 to topics such as foliated cohomology the theory of the Dolbeault Kostant complex and their applications A discussion of the relation between geometric quantization and the Marsden Weinstein reduction is presented in Chapter 9 The final chapter considers extending the theory of geometric quantization to Poisson manifolds via the theory of symplectic groupoids Each chapter concludes with problems and solutions many of which present significant applications and in some cases major theorems For graduate students and researchers whose interests and work involve symplectic geometry and Hamiltonian mechanics

Oscillation Theory of Two-Term Differential Equations Uri Elias, 2013-03-14 Oscillation theory was born with Sturm s

work in 1836 It has been flourishing for the past fifty years Nowadays it is a full self contained discipline turning more towards nonlinear and functional differential equations Oscillation theory flows along two main streams The first aims to study properties which are common to all linear differential equations The other restricts its area of interest to certain families of equations and studies in maximal details phenomena which characterize only those equations Among them we find third and fourth order equations self adjoint equations etc Our work belongs to the second type and considers two term linear equations modeled after $y^{(n)} + p(x)y = 0$ More generally we investigate $L_n y + p(x)y = 0$ where L_n is a disconjugate operator and $p(x)$ has a fixed sign These equations enjoy a very rich structure and are the natural generalization of the Sturm Liouville operator Results about such equations are distributed over hundreds of research papers many of them are reinvented again and again and the same phenomenon is frequently discussed from various points of view and different definitions of the authors Our aim is to introduce an order into this plenty and arrange it in a unified and self contained way The results are readapted and presented in a unified approach In many cases completely new proofs are given and in no case is the original proof copied verbatim Many new results are included
