Computational Methods to Study the Structure and Dynamics of Biomolecules and Biomolecular Processes

Adam Liwo, 2018-12-19 This book provides a comprehensive overview of modern computer based techniques for analyzing the structure properties and dynamics of biomolecules and biomolecular processes. It is organized in four main parts: the first one deals with methodology of molecular simulations; the second one with applications of molecular simulations; the third one introduces bioinformatics methods and the use of experimental information in molecular simulations; the last part reports on selected applications of molecular quantum mechanics. This second edition has been thoroughly revised and updated to include the latest progresses made in the respective field of research.

Comets II M. Festou, H. U. Keller, Harold A. Weaver, 2004-11 The study of comets is a field that has seen tremendous advances in recent years far surpassing the knowledge reflected in the original Comets volume published as part of the Space Science Series in 1982. This new volume with more than seventy contributing authors represents the first complete overview of comet science in more than a decade and contains the most extensive collection of knowledge yet assembled in the field. Comets II situates comet science in the global context of astrophysics for the first time by beginning with a series of chapters that describe the connection between stars and planets. It continues with a presentation of the formation and evolution of planetary systems enabling the reader to clearly see the key role played in our own solar system by the icy planetesimals that were the seeds of the giant planets and transneptunian objects. The book presents the key results obtained during the 1990s in particular those collected during the apparition of the exceptional comets C Hyakutake and C Hale Bopp in 1996–1997. The latest results obtained from the in situ exploration of comets P Borrelly and P Wild 2 are also discussed in detail. Each topic is designed to be accessible to students or young researchers looking for basic yet detailed complete and accurate information on comet science. With its emphasis on the origin of theories and the future of research Comets II will enable scientists to make connections across disciplinary boundaries and will set the stage for discovery and new understanding in the coming years.

Interpreting Bodies Elena Castellani, 2020-12-08 Bewildering features of modern physics such as relativistic space time structure and the peculiarities of so called quantum statistics challenge traditional ways of conceiving of objects in space and time. Interpreting Bodies brings together essays by leading philosophers and scientists to provide a unique overview of the implications of such physical theories for questions about the nature of objects. The collection combines classic articles by Max Born, Werner Heisenberg, Hans Reichenbach and Erwin Schrödinger with recent contributions including several papers that have never

before been published The book focuses on the microphysical objects that are at the heart of quantum physics and addresses issues central to both the foundational and the philosophical debates about objects Contributors explore three subjects in particular how to identify a physical object as an individual the notion of invariance with respect to determining what objects are or could be and how to relate objective and measurable properties to a physical entity The papers cover traditional philosophical topics common sense questions and technical matters in a consistently clear and rigorous fashion illuminating some of the most perplexing problems in modern physics and the philosophy of science The contributors are Diederik Aerts Max Born Elena Castellani Maria Luisa Dalla Chiara Bas C van Fraassen Steven French Gian Carlo Ghirardi Roberto Giuntini Werner Heisenberg Decio Krause David Lewis Tim Maudlin Peter Mittelstaedt Giulio Peruzzi Hans Reichenbach Erwin Schrodinger Paul Teller and Giuliano Toraldo di Francia

Cytochrome P450 John B. Schenkman, Helmut Greim, 2013-03-08 In this book the editors have brought together the widest group of investigators of the cytochrome P450 superfamily in order to present complete and right up to date coverage of this important enzyme system The authors describe and analyze the components of the enzyme system the reaction mechanisms involved and the evolution and nomenclature of this superfamily of enzymes They also describe the hepatic microsomal enzyme in a large number of species from mammalian to birds and fish to plants and unicellular organisms The different P450 forms in different tissues of the mammalian system are also treated Regulatory factors of P450 expression receive considerable attention as do studies on the mechanism of interaction of the microsomal monooxygenase system components Of particular interest to the reader are for the first time a compilation of chapters dedicated to forms of cytochrome P450 involved in steroid hormone biosynthesis This volume presents the most complete survey of the cytochrome P450 field It will allow recognition and understanding of the very wide implications this enzyme system has on life processes

A Novel Approach to Relativistic Dynamics Yaakov Friedman, Tzvi Scarr, 2023-02-18

This self contained monograph provides a mathematically simple and physically meaningful model which unifies gravity electromagnetism optics and even some quantum behavior The simplicity of the model is achieved by working in the frame of an inertial observer and by using a physically meaningful least action principle The authors introduce an extension of the Principle of Inertia This gives rise to a simple physically meaningful action function Visualizations of the geometry are obtained by plotting the action function These visualizations may be used to compare the geometries of different types of fields Moreover a new understanding of the energy momentum of a field emerges The relativistic dynamics derived here properly describes motion of massive and massless objects under the influence of a gravitational and or an electromagnetic field and under the influence of isotropic media The reader will learn how to compute the precession of Mercury the deflection of light and the Shapiro time delay Also covered is the relativistic motion of binary stars including the generation of gravitational waves a derivation of Snell s Law and a relativistic description of spin We derive a complex valued

prepotential of an electromagnetic field The prepotential is similar to the wave function in quantum mechanics The mathematics is accessible to students after standard courses in multivariable calculus and linear algebra For those unfamiliar with tensors and the calculus of variations these topics are developed rigorously in the opening chapters The unifying model presented here should prove useful to upper undergraduate and graduate students as well as to seasoned researchers

Atomic and Molecular Nonlinear Optics: Theory, Experiment and Computation G. Maroulis,T. Bancewicz,B.
