

Relevant spinal trauma with risk of development of secondary traumatic spinal cord injury

Critical ABC problem

A: airway blocked or at risk

B: suspicion of pneumothorax, hemothorax, flail chest or hypoxia

C: threatened or manifest circulatory instability

Osseous tenderness on spinal palpation

Direct or indirect tenderness on palpation of proc. spinosi

Instead of asking the patient about tenderness on palpation, interpretation of the patient's reaction on palpation is recommended (e.g. facial expression)

Neurological deficit

Affected ability of handshake and/or dorsal flexion and extension of feet

Affected sensibility of arms, legs and/or trunk (quick examination)

Time-critical spinal stabilisation

Generally, only measures of spinal stabilisation, that do not delay any other necessary ABCDE-measures or transport to hospital

Type of spinal stabilisation is dependent on the situation (vacuum mattress, spineboard, scoopboard or equivalent, stretcher, possibly in combination with SLS)

Spinal stabilisation

Prehospital: positioning and transport on a vacuum mattress without use of a rigid cervical collar

In-hospital: dependent of neurologic findings; in case of neurologic deficit

Initial contact to patient prehospital:

- Positioning on a vacuum mattress
- After arrival to hospital: repositioning on a padded backboard, incl. headblocks and straps

Extrication:

- self-extrication: if osseous spinal tenderness on palpation is the only symptom and self-extrication is possible otherwise
- assisted extrication with and/or positioning on situation-dependent devices (recommended)

Initial contact to patient in-hospital:

- if neurological deficit: positioning on padded backboard
- if no neurologic deficit: self-positioning on most relevant device (e.g. stretcher, bed, chair, etc.) in order to achieve maximum patient comfort
