Spectral Theory Of Indefinite Kreinfeller Differential Operators:

Spectral Theory of Indefinite Krein-Feller Differential Operators Andreas Fleige, 1996-08-15 The vibration of a string with a nondecreasing mass distribution function m leads to a generalized differential equation of second order introduced by Krein and by Feller The author allows also nonmonotonic functions m and hence gets into the theory of indefinite inner product spaces Here at the first time a systematic presentation of the generalized differential expression and of J selfadjoint operator realizations is given Developing a spectral theory for such Krein Feller operators the author derives the most general known criteria for the regularity of the critical point infinity Then by specialization expansion theorems for wide classes of indefinite second order differential and difference operators are obtained [Spectral Theory in Inner Product](#)

Kaashoek, Reinhard Mennicken, 2012-12-06 This volume is dedicated to Heinz Langer a leading expert in spectral analysis and its applications in particular to operators in spaces with an indefinite metric on the occasion of his 60th birthday The book begins with his biography and list of publications It contains a selection of research papers most of which are devoted to spectral analysis of operators or operator pencils with applications to ordinary and partial differential equations Other papers deal with time varying systems interpolation and factorization problems and topics from mathematical physics About half of the papers contain further developments in the theory of operators in spaces with an indefinite metric and treat new applications The book is of interest to a wide audience of pure and applied mathematicians

Complex Interval Arithmetic and Its Applications Miodrag Petković, Ljiljana D. Petkovic, 1998 The aim of this book is to present formulas and methods developed using complex interval arithmetic While most of numerical methods described in the literature deal with real intervals and real vectors there is no systematic study of methods in complex interval arithmetic The book fills this gap Several main subjects are considered outer estimates for the range of complex functions especially complex centered forms the best approximations of elementary complex functions by disks iterative methods for the inclusion by polynomial zeros including their implementation on parallel computers the analysis of numerical stability of iterative methods by using complex interval arithmetic and numerical computation of curvilinear integrals with error bounds Mainly new methods are presented developed over the last years including a lot of very recent results by the authors some of which

This monograph describes mathematical methods applicable to studying nonclassical problems of mathematical physics The emphasis of the book is on applications of the interpolator theory of Banach spaces to the theory of linear operators to be expotentially dichotomous to some continuity properties of linear operators in Hilbert scales to the Riesz basis property of eigenelements and associated elements of linear pencils and the correspondending elliptic problems with indefinite weight functions and to studying nonclassical boundary value problems for first order operator differential equations Algebras of Pseudodifferential Operators Near Edge and Corner Singularities Christoph Dorschfeldt,1998-09-16 This research monograph deals with analysis on manifolds with singularities More precisely it presents pseudodifferential operators near edges and corners In particular it considers parameter dependent edge operators and edge operators of Mellin type The investigation of such operator families is necessary to construct operator algebras on manifolds with higher singularities A self contained exposition in Mellin techniques and pseudodifferential operators with operator valued symbols is given The algebra of parameter dependent edge operators is constructed Finally Mellin operators near corner singularities are investigated The focus is on elliptic theory Elliptic operators on manifolds with edges are constructed as well as parametrices to elliptic elements The equivalence of ellipticity and the Fredholm property is shown Close to corner singularities edge operators of Mellin type are defined a pseudodifferential calculus is presented and parametrices are constructed Asymptotics are treated using analytic functions and the concept of continuous asymptotic types *Brownian Motion and Index Formulas for the de Rham Complex* Kazuaki Taira,1998 This book is an easy to read reference providing a link between partial differential equations pde stochastic analysis and index theory Most mathematicians working in pde are only vaguely familiar with the powerful ideas of stochastic analysis On the other hand the additional intuition which Taira s book conveys might provide better insight and be helpful for their work In addition the book provides a nice compendium for a large variety of facts from differential geometry functional analysis pseudodifferential operators and Markov processes for quickly looking up a theorem **Topics in Torsion Theory** Paul E. Bland,1998-11-30 Torsion theory provides an umbrella under which many classical properties of rings and modules can be reformulated The purpose of this book is to provide the reader with a quick introduction to torsion theory and to study selected properties of rings and modules in this setting The material presented ranges from a torsion theoretical treatment of standard topics in ring and module theory to how previously untreated properties of rings and modules might be dealt with in this setting The approach has been to develop the material so that classical results can be recovered by selecting an appropriate torsion theory Simple modules maximal submodules the Jacobson radical and modules with chain conditions are investigated relative to a torsion theory A relative form of Nakayama s lemma is given and a generalized Hopkins Levitzki theorem is established Injective and projective concepts are studied and a generalized Baer s condition for injective modules and a generalized Fuchs condition for quasi injective modules are shown

to hold Flat modules and covers and hulls of modules are investigated and the concept of a relative quasi projective cover is used to characterize those rings which are right perfect modulo their torsion ideal Torsion free covers are also studied and results are given which generalize well known results on torsion free covers for modules with usual torsion over an integral domain Finally semi primitive semi simple and semi prime rings are investigated in a torsion theoretical setting and rings which are right primitive relative to a torsion theory are linked to a form of density which is reminiscent of Jacobson density for right primitive rings

Partial Differential Equations Todor V. Gramchev, Petar R. Popivanov, 2000-02-22 The applications of methods from microlocal analysis for PDE have been a fast developing area during the last years The authors both are well known in the community publish for the first time some of their research results in a summarized form The essential point of the approach is the use of the various types of approximate asymptotic solutions in the study of differential equations in the smooth and the Gevrey spaces In this volume the authors deal with the following themes Microlocal properties of pseudodifferential operators with multiple characteristics of involutive type in the framework of the Sobolev spaces Abstract schemes for constructing approximate solutions to linear partial differential equations with characteristics of constant multiplicity m greater than or equal 2 in the framework of Gevrey spaces Local solvability hypoellipticity and singular solutions in Gevrey spaces Global Gevrey solvability on the torus for linear partial differential equations Applications of asymptotic methods for local non solvability for quasihomogeneous operators Applications of Airy asymptotic solutions to degenerate oblique derivative problems for second order strictly hyperbolic equations Approximate Gevrey normal forms of analytic involutions and analytic glancing hypersurfaces with applications for effective stability estimates for billiard ball maps **Initial**

Approximations and Root Finding Methods Nikolay V. Kyurkchiev, 1998-10-27 Polynomials as mathematical objects have been studied extensively for a long time and the knowledge collected about them is enormous Polynomials appear in various fields of applied mathematics and engineering from mathematics of finance up to signal theory or robust control The calculation of the roots of a polynomial is a basic problems of numerical mathematics In this book an update on iterative methods of calculating simultaneously all roots of a polynomial is given a survey on basic facts a lot of methods and properties of those methods connected with the classical task of the approximative determination of roots For the computer determination the choice of the initial approximation is of special importance Here the authors offers his new ideas and

research results of the last decade which facilitate the practical numerical treatment of polynomials **Transient Tunnel Effect and Sommerfeld Problem** Felix Ali Mehmeti, 1996-10-24 The author investigates the n time decay of solutions of the Klein Gordon equation in one space dimension with a semi infinite potential step and derives a limiting absorption principle for the wave equation in two space dimensions with zero Dirichlet conditions imposed on a half axis These are model cases for transient waves in media with semi infinite geometry involving interfaces and cracktips
