Edwards, 2020-07-13 This book addresses the contributions made by analytical chemistry to the characterisation of 18th and early 19th Century English and Welsh porcelains commencing with the earliest reports of Sir Arthur Church and of Herbert Eccles and Bernard Rackham using chemical digestion techniques and concluding with the most recent instrumental experiments which together span more than a hundred years of study From the earliest experiments which required necessarily the sacrifice of significant portions of each specimen which may already have been damaged to the latest experiments which needed only microsampling or the non destructive interrogation of valuable perfect specimens a comprehensive survey is undertaken of more than twenty manufactories of quality porcelains The correlation is made between the quantitative elemental oxide determinations of the scanning electron microscopic diffraction and Xray fluorescence data and the qualitative molecular spectroscopic Raman data to demonstrate their complementarity and use in the holistic forensic assessment of the origin of the fired porcelains this will form the groundwork for the adoption of analytical techniques for the attribution of unknown or

questionable porcelains to their potential source factories The book will also examine the perception of what constitutes a porcelain and its definitions and examines the assignment of porcelains to types which currently employs the definitions of hard paste soft paste hybrid magnesian and bone china from the conclusions derived from the analytical data and a consideration of the raw materials employed in their manufacturing processes During the discussion of this analytical evidence several themes and protocols have been established for its utilisation in the potential identification of porcelains and several case studies undertaken for this purpose are cited The book will be of interest to analytical scientists to museum ceramics curators and to ceramics historians
