Smith,2021-04-25 In Kyphosis and Other Variations in Soft shelled Turtles Hobart M Smith presents a comprehensive exploration of the anatomical and ecological diversity within soft shelled turtles focusing particularly on the intriguing condition of kyphosis Smith s meticulous research is portrayed through a blend of empirical data and nuanced observation situating these reptiles within the broader

context of herpetological studies The text is characterized by a clear scholarly style that meticulously details variations in shell morphology behavior and habitat culminating in a profound understanding of the evolutionary adaptations of these animals Hobart M Smith a prominent figure in the field of herpetology has spent decades studying turtle biology and conservation His expertise is grounded in both fieldwork and academic research earning him a reputation as a leading authority on turtle species Smith s passion for reptiles coupled with a desire to advocate for their conservation has significantly influenced his writing encouraging a focus on the often overlooked complexities of turtle anatomy and ecology This book is essential reading for biologists ecologists and anyone interested in the fascinating world of reptiles Smith s insights not only deepen our understanding of soft shelled turtles but also challenge readers to consider the implications of morphological variations on species survival It is a crucial contribution to herpetological literature that deserves a place on the shelves of both scholars and enthusiasts

Turtles of the World Franck Bonin, Bernard Devaux, Alain Dupré, 2006-10-16 Publisher description **The Molecular Evolution of Non-Coding DNA and Population Ecology of the Spiny Softshell Turtle (*Apalone spinifera*) in Lake Champlain** Lucas E. Bernacki, 2015 ABSTRACT Spiny softshell turtles *Apalone spinifera* occur at the northwest limit of their range in Lake Champlain This species although widespread across North America is listed as threatened in Vermont due to habitat destruction and disturbances of anthropogenic origin The population of spiny softshell turtles in Lake Champlain is isolated from other North American populations and is considered as an independent management unit Efforts to obtain information on the biology of spiny softshell turtles in Lake Champlain precede 1936 with conservation measures being initiated in 1987 Methods of studying spiny softshell turtles in Lake Champlain have included direct observation mark recapture nest beach monitoring winter diving and radio telemetry Each of these approaches has provided some information to the sum of what is known about *A. spinifera* in Lake Champlain For example major nesting beaches hibernacula and home range size have been determined Currently spiny softshell turtles primarily inhabit two areas within Lake Champlain Missisquoi Bay and the mouth of the Lamoille River However the population structure and gene flow between spiny softshell turtles inhabiting the Lamoille and Missisquoi regions remained unknown A GIS model was created and tested in order to

identify additional nesting beaches used by spiny softshell turtles along the Vermont shores of Lake Champlain. Although some additional small potential nesting beaches were found, no additional major nesting sites were found. The GIS model identified the mouth of the Winooski River the site of a historical population as potentially suitable nesting habitat; however, no evidence of spiny softshell turtle nesting was found at this site. A series of methods developed for collecting molecular and population genetic data about spiny softshell turtles in Lake Champlain are described, including techniques for DNA extraction of various tissue types and the design of new primers for PCR amplification and sequencing of the mitochondrial control region mtD loop. Techniques for circumventing problems associated with DNA sequence alignment in regions of a variable number of tandem repeats VNTRs and the presence of heteroplasmy within some individuals are also described. The mtD loop was found to be a suitable marker to assess the genetic structure of the Lake Champlain population of spiny softshell turtles. No significant genetic sub structuring was found $F_{ST} = 0.082$, $p = 0.223$, and an indirect estimate of the migration rate between Lamoille and Missisquoi regions of Lake Champlain was high $N_m = 5.576$. In addition to consideration of *A. spinifera* in Lake Champlain, the mtD loop was modeled across 46 species in 14 families of extant turtles. The primary structure was obtained from DNA sequences accessed from GenBank, and secondary structures of the mtD loop were inferred from thermal stabilities using the program Mfold for each superfamily of turtles. Both primary and secondary structures were found to be highly variable across the order of turtles; however, the inclusion of an AT-rich fold secondary structure near the 3' terminus of the mtD loop was common across all turtle families considered. The Cryptodira showed conservation in the primary structure at regular conserved sequence blocks CSBs, but the Plurodora displayed little conservation in the primary structure of the mtD loop. Overall, greater conservation in secondary structure than primary structure was observed in turtle mtD loop. The AT-rich secondary structural element near the 3' terminus of the mtD loop may be conserved across turtles due to it serving a functional role during mtDNA transcription.

Amphibians and Reptiles Native to Minnesota Barney Oldfield, 1994. Offers substantial information designed for use by both amateurs and specialists and useful to residents of other Upper Midwest states and bordering Canadian provinces as well. Introductory chapters present the history of herpetology in Minnesota, the preferred habitats of these species, techniques.
