Blue Economy and Ocean Sustainable Development in a Globalised World: Social, Political, Economic and Environmental Issues Ibukun J. Adewumi, Andrei Polejack, Joanna Vince, Maree E. Fudge, 2023-12-05 In the last decade the concept of a Blue Economy has ignited a deep theoretical debate Ranging from the integration of the triple bottom line of sustainability to the optimization of profit from ocean exploitation the meaning of the term blue economy differs considerably between epistemic communities and even more so among national and regional policies There is a general sense of the opportunity to realise enhanced social and economic benefits from the sustainable utilisation of their ocean and coastal resources under the umbrella framework of blue economy Blue economy is gaining traction already as a significant component of national policies even in spite of a clear conceptualization of the term Many countries are now preparing national policies towards realising their blue economy ambitions utilizing the concept as they see fit Likewise multilateral and regional organisations are developing guidelines and providing investment in new research technologies and financing tools that promote blue economy Critical challenges abound in particular in less privileged countries These include the gap in research capabilities governments prioritizing social wellbeing and economic profit in contrast to environmental protection the identification of new and emerging areas of ocean economic activity that are both socially and ecologically sustainable and holds viable business models that can attract private investment

In 1999 the National Academies of Sciences Engineering and Medicine released a landmark report *Our Common Journey A Transition toward Sustainability* which attempted to reinvigorate the essential strategic connections between scientific research technological development and societies efforts to achieve environmentally sustainable improvements in human well being 1 The report emphasized the need for place based and systems approaches to sustainability proposed a research strategy for using scientific and technical knowledge to better inform the field and highlighted a number of priorities for actions that could contribute to a sustainable future The past 15 years have brought significant advances in observational and predictive capabilities for a range of natural and social systems as well as development of other tools and approaches useful for sustainability planning In addition other frameworks for environmental decision making such as those that focus on climate adaptation or resilience have become increasingly prominent A careful consideration of how these other approaches might intersect with sustainability is warranted particularly in that they may affect similar resources or rely on similar underlying scientific data and models To further the discussion on these outstanding issues the National Academies of Sciences Engineering and Medicine convened a workshop on January 14 15 2016 Participants discussed progress in sustainability science during the last 15 years potential opportunities for advancing the research and use of scientific knowledge to support a transition toward sustainability and challenges specifically related to establishing indicators and observations to support sustainability research and practice This report summarizes the presentations and discussions from the workshop
