The Frozen Earth Fundamentals Of Geocryology Studies In Polar Research:

The Frozen Earth Peter (Carleton University Williams, Peter John Williams, Michael W. Smith, 1991 **The Frozen Earth** Peter John Williams, 1991 **Permafrost Soils** Rosa Margesin, 2008-10-31 Most of the Earth's biosphere is characterized by low temperatures. Vast areas 20% of the soil ecosystem are permanently frozen or are unfrozen for only a few weeks in summer. Permafrost regions occur at high latitudes and also at high elevations. A significant part of the global permafrost area is represented by mountains. Permafrost soils are of global interest since a significant increase in temperature is predicted for polar regions. Global warming will have a great impact on these soils especially in northern regions since they contain large amounts of organic carbon and act as carbon sinks and a temperature increase will result in a release of carbon into the atmosphere. Additionally, the intensified release of the climate-relevant tracer gas methane represents a potential environmental hazard. Significant numbers of viable microorganisms including bacteria, archaea, phototrophic cyanobacteria, and green algae, fungi, and protozoa are present in permafrost and the characteristics of these microorganisms reflect the unique and extreme conditions of the permafrost environment. Remarkably, these microorganisms have been reported to be metabolically active at subzero temperatures even down to -20 °C. *Natural Methane Emissions in a Changing Arctic - Implications for Climate and Environment* Karin Andreassen, Jochen Knies, Susanne Liebner, Andrew Jonathan Hodson, Carolyn Ruppel, 2024-11-06 Natural emissions of methane have received much attention over the last decade due to the documented increase of methane in the atmosphere and high global warming potential relative to CO₂. Over the past few decades, the Arctic has been warming approximately four times faster than the rest of the planet, driving a pressing need to assess the current and future vulnerability of various natural methane sources. In the Arctic, vast amounts of methane are stored in soils and permafrost or are being generated as permafrost thaw continues. Additionally, there are large stores of methane in Arctic gas hydrates, a solid form of concentrated methane and water, and in numerous settings including deep water marine areas on continental shelves hosting relict subsea permafrost and gas hydrate in and beneath onshore permafrost and likely beneath the Greenland Ice Sheet. Continued climate warming is making methane leakage more likely. Even deeper conventional gas reservoirs could leak methane as the overlying permafrost degrades. **Pre-Mesozoic Ice Ages** John C. Crowell, 1999-01-01 Ancient ice ages are revealed by distinctive stratal facies that tell us much about the times of coolness and how the climate system works. Several strong ice ages were recorded in the late Paleozoic time and during transitions from the Devonian into the Carboniferous and from the Ordovician into the Silurian. In Precambrian time, several are documented for both the late and early Proterozoic age. This title explores findings on the pre-Mesozoic ice ages, examining climate in relation to tectonobiogeochemical activities rooted in the changing earth-air-ocean system. **Polar Research**, 1998 **Snow and Ice-Related Hazards, Risks, and Disasters** Wilfried Haeberli, Colin Whiteman, 2021-02-12 *Snow and Ice Related Hazards Risks and Disasters* Second Edition provides you with the latest scientific developments in sea
