Smoothing Spline ANOVA Models Chong Gu, 2013-03-09 Nonparametric function estimation with stochastic data otherwise known as smoothing has been studied by several generations of statisticians Assisted by the recent availability of ample desktop and laptop computing power smoothing methods are now finding their ways into everyday data analysis by practitioners While scores of methods have proved successful for univariate smoothing ones practical in multivariate settings number far less Smoothing spline ANOVA models are a versatile family of smoothing methods derived through roughness penalties that are suitable for both univariate and multivariate problems In this book the author presents a comprehensive treatment of penalty smoothing under a unified framework Methods are developed for i regression with Gaussian and non Gaussian responses as well as with censored life time data ii density and conditional density estimation under a variety of sampling schemes and iii hazard rate estimation with censored life time data and covariates The unifying themes are the general penalized likelihood method and the construction of multivariate models with built in ANOVA decompositions Extensive discussions are devoted to model construction smoothing parameter selection computation and asymptotic convergence Most of the computational and data analytical tools discussed in the book are implemented in R an open source clone of the popular S S PLUS language Code for regression has been distributed in the R package gss freely available through the Internet on CRAN the Comprehensive R Archive Network The use of gss facilities is illustrated in the book through simulated and real data examples

Smoothing Spline ANOVA Models and Their Applications in Complex and Massive Datasets Jingyi Zhang, 2018 Complex and massive datasets can be easily accessed using the newly developed data acquisition technology In spite of the fact that the smoothing spline ANOVA models have proven to be useful in a variety of fields these datasets impose the challenges on the applications of the models In this chapter we present a selected review of the smoothing spline ANOVA models and highlight some challenges and opportunities in massive datasets We review two approaches to significantly reduce the computational costs of fitting the model One real case study is used to illustrate the performance of the reviewed methods

The book is based on several years of experience of both authors in teaching linear models at various levels It gives an up to date account of the theory and applications of linear models The book can be used as a text for courses in statistics at the graduate level and as an accompanying text for courses in other areas Some of the highlights in this book are as follows A relatively extensive chapter on matrix theory Appendix A provides the necessary tools for proving theorems discussed in the text and offers a selection of classical and modern algebraic results that are useful in research work in econometrics engineering and optimization theory The matrix theory of the last ten years has produced a series of fundamental results about the definiteness of matrices especially for the differences of matrices which enable superiority comparisons of two biased estimates to be made for the first time We have attempted to provide a unified theory of inference from linear models with minimal assumptions

Besides the usual least squares theory alternative methods of estimation and testing based on convex loss functions and general estimating equations are discussed. Special emphasis is given to sensitivity analysis and model selection. A special chapter is devoted to the analysis of categorical data based on logit, loglinear and logistic regression models. The material covered, theoretical discussion and a variety of practical applications, will be useful not only to students but also to researchers and consultants in statistics.
