- The strict-sense nonblocking
 - There is a possibility to connect any free input with any free output regardless the switching fabric's state and the way of choosing resources.
- The wide-sense nonblocking
 - There is a possibility to connect any free input with any free output regardless the switching fabric's state, but we have to use the special control algorithm to choose resources.

Nonblocking Electronic and Photonic Switching Fabrics Wojciech Kabacinski, 2005-08-12 Surveys recent advances in combinatorial properties of switching fabrics Written by an expert in the area of switching fabrics

TELECOMMUNICATION SYSTEMS AND TECHNOLOGIES-Volume I Paolo Bellavista , 2009-10-17 Telecommunication Systems and Technologies theme is a component of Encyclopedia of Physical Sciences Engineering and Technology Resources in the global Encyclopedia of Life Support Systems EOLSS which is an integrated compendium of twenty one Encyclopedias Telecommunication systems are emerging as the most important infrastructure asset to enable business economic opportunities information distribution culture dissemination and cross fertilization and social relationships As any crucial infrastructure its design exploitation maintenance and evolution require multi faceted know how and multi disciplinary vision skills The theme is structured in four main topics Fundamentals of Communication and Telecommunication Networks Telecommunication Technologies Management of Telecommunication Systems Services Cross Layer Organizational Aspects of Telecommunications which are then expanded into multiple subtopics each as a chapter These two volumes are aimed at the following five major target audiences University and College students Educators Professional practitioners Research personnel and Policy analysts managers and decision makers and NGOs Optical Switching Tarek S. El-Bawab, 2008-02-11 Optical Switching is the most comprehensive and up to date reference book on its subject After three decades of research and development efforts optical switching has started to be deployed in cutting edge networking initiatives The optical devices optical networks and telecommunications data networking communities are in need of a reference book that compiles diverse optical switching research from device technologies to system and network architectures into one properly structured volume This book provides such a service to these communities The book is structured into three parts The first part provides the foundation for understanding the potential role of optical switching in communication networks The second part is focused on optical switching technologies and on devices based upon them Theories operation principles and fabrication techniques are discussed The third part covers optical switching fabrics systems and networks Applications of optical switching in communication networks are discussed involving optical circuit packet and burst switching The chapters are self contained with minimum overlap They bring together academic and industrial contributions analytical and descriptive treatments and cover theories experimentation and practice The material has been carefully coordinated to form a homogeneous manuscript having a progressive and logical development of ideas and concepts The book embraces a number of distinctive innovations Old and new terminologies are investigated clarified redefined where necessary and used consistently throughout the entire volume The treatment of the subject is original not only in terms of comprehensive coverage but also in terms of structure and organization Twenty four authors contributed the fourteen chapters of this book including the Editor Tarek S El Bawab who authored four chapters Nonblocking Electronic

and Photonic Switching Fabrics Wojciech Kabacinski, 2005-12-06 Switching fabrics first appeared in telephone exchanges where there was a need to interconnect many pairs of telephones installed in the network. Due to the large number of connected subscribers and inter-exchange links, switching fabrics in telephone exchanges have to serve a great number of input and output ports. Because of the scale, large switching fabrics were constructed from smaller ones. The way of building switching fabrics from elements of smaller capacity and different characteristics of switching fabrics topologies has been for a long time a rich area of theoretical research. The seminal work is due to C Clos [23] who first considered multistage strict sense nonblocking switching networks and V E Benes [9] who first introduced the mathematical theory of switching networks. From that time many research was conducted in this field. Switching fabrics found its application not only in telecommunication starting from telephone exchanges through ATM switches and IP routers to optical cross connect systems and optical packet switches but also in other areas of knowledge like computation and control. Theory of switching fabrics becomes also a part of applied mathematics. Results of studies carried out by researchers from these areas were published in numerous papers and some books. This book is intended for people interested in the switching theory and especially combinatorial characteristics of switching networks. It contains a considerable amount of already known results. Some of them are presented in more detailed form, other are only mentioned.

Architectures for Quality of Service in the Internet Wojciech Burakowski, Berthold Koch, Andrzej Bęben, 2003-06-23 Providing Quality of Service (QoS) in the Internet is currently the most challenging topic for researchers, industry and network providers. Now the only available service in the Internet is the best effort service which assumes traffic is processed as quickly as possible but there is no guarantee as to timely or actual delivery. On the other hand there is pressure to offer new applications in the Internet like VoIP, videoconferencing, on-line games, e-commerce etc but this requires some packet transfer guarantees from the network e.g. low packet transfer delay, low packet losses. To meet these requirements new architectures for providing IP based QoS in the Internet are proposed: Integrated Services (IntServ) and Differentiated Services (DiffServ). However these architectures need some enhancements to provide adequate solutions for resource management, signaling, traffic engineering, traffic handling mechanisms etc. In the European research community a number of projects inside the Fifth Framework Programme were addressed solving the above issues among these: AQUILA (Adaptive Resource Control for QoS Using an IP Based Layered Architecture), CADENUS (Creation and Deployment of End User Services in Premium IP Networks) and TEQUILA (Traffic Engineering for Quality of Service in the Internet at Large Scale) are excellent examples. The main achievements from these projects are the prototypes for fixed QoS IP networks. The extension of these proposed solutions into the wireless environment is the next step.
