5. CONCLUSIONS

In this paper, we presented a novel approach toward solving camera tracking by tracking a projection of the plane. A non-linear image alignment is adopted and correct parameters of the transformation are recovered by optimizing the similarity between the planar regions. A thorough comparative analysis of the method over simulated and real sequence of images reveal that the proposed method has ability to track planar surfaces in which the motion within the frames is kept small. The insensitivity of the method toward intensity variations as well as to unavailability of true plane normal is also tested and algorithm has been found robust to such environmental changes.
