Synergetics Strength And Fracture Of Metallic Materials

Vera Semenovna Ivanova

Synergetics Strength And Fracture Of Metallic Materials:

Synergetics Vera Semenovna Ivanova, 1998 In approaches of a new science synergetics the deformed solid is examined as a synergetic system exchanging energy and matter with the environment Taking these approaches and fractal theory into account the author generalizes the literature data on the mechanical behaviour of materials Fracture is interpreted as a nonequilibrium phase transition preceded by spontaneous rearrangement of the dislocation substructure Parameters characterising the dissipative properties of materials are proposed and the existence of an universal relationship between the fundamental mechanical properties on micro and macro levels is shown Extensive experimental data confirming this relationship on the basis of steels with different strength levels are presented

Fractals, Applied Synergetics and Structure Design V. S. Ivanova, V. U. Novikov, A. A. Oksogoev, 2005 Non linear systems behaviours are discussed in this book from the point of new scientific approaches to the interdisciplinary nature of the fractal geometry and synergetics Fractal analysis synergetics methods and mathematical design are considered according to actual problems of condensed media physics mechanics material science and geology

Fractal Analysis and Synergetics of Catalysis in Nanosystems G. V. Kozlov, Gennadii Efremovich Zaikov, 2008 Nanochemistry is a science connected with obtaining and studying of physical chemical properties of particles having sizes on the nanometer scale This book addresses polymer synthesis which according to Melikhov's classification is automatically part of nanochemistry This is determined as far as polymeric macromolecules more precisely macromolecular coils belong to nanoparticles and polymeric sols and gels to nanosystems Catalysis on nanoparticles is one of the most important sections of nanochemistry The majority of catalytic systems are nanosystems At heterogeneous catalysis the active substance is tried to deposit on carrier in nanoparticles form in order to increase their specific surface At homogeneous catalysis active substance molecules have often in themselves nanometer sizes The most favorable conditions for homogeneous catalysis are created when reagent molecules are adsorbed rapidly by nanoparticles and are desorbed slowly but have high surface mobility and consequently high reaction rate on the surface and at the reaction molecules of such structure are formed at which desorption rate is increased sharply If these conditions are realised in nanosystem with larger probability than in macrosystem then nanocatalyst has the raising activity that was observed for many systems

Materials Engineering and Technologies for Production and Processing III Andrey A. Radionov, 2017-09-25 ICIE 2017 Selected peer reviewed papers from the International Conference on Industrial Engineering May 16 19 2017 Saint Petersburg Russian Federation

Paradigms Of Complexity: Fractals And Structures In The Sciences Miroslav M Novak, 2000-04-18 Every reader will find something of interest in this book from superdiffusion of the ocean surface to fetal heartbeats from solar wind to the wearing out of tools from radioactive contamination to texture analysis from image rendering to neural developments The all pervading link connecting these disparate disciplines is the realization that a linear approach to the majority of natural processes is at best only an approximation that can frequently be downright misleading

Consequently the rise of what is broadly called the theory of complexity has gained tremendous momentum in the last decade or two This modern approach aims at and frequently succeeds in correctly explaining many natural processes The papers in this volume are based on presentations of the sixth international conference exploring the above mentioned issues These conferences are now regular and well established among the nonlinear series of conferences This conference series is organized in different geographical regions to encourage international collaboration Among the distinguishing features of the series is its multidisciplinary nature which has been growing steadily

The Fractal Physics of Polymer Synthesis G. V. Kozlov, A. K. Mikitaev, Gennady Efremovich Zaikov, 2013-12-12 Using fractal analysis irreversible aggregation models synergetics and percolation theory this book describes the main reactions of high molecular substances It is the first to give the structural and physical grounds of polymers synthesis and curing based on fractal analysis It provides a single equation for describing the relationship between **Structure and Properties of Crosslinked Polymers** Gasan M

Magomedov, 2011-03-23 This book gives a fresh point of view on the curing processes structure and properties of crosslinked polymers The general view is that the structure and properties of crosslinked polymers are defined by their density this book demonstrates that the parameters are defined by the supermolecular a more precisely supersegmental structure of the crosslinked polymers The quantitative relationships of the structures properties are obtained for these polymers Using an epoxy polymer as a nanofiller for a nanocomposite is discussed and a new class of polymer is proposed The introduction of the nanofiller gives variation in the mechanical properties degree of crystallinity gas permeability and so on The use of these crosslinked polymers as natural nanocomposites is proposed Practical methods of crosslinked polymers supersegmental structure regulation are considered and all the changes that this gives their properties are detailed This book will be of significance to all material scientists and students of material science

Damage and Fracture of Heterogeneous Materials Leon L. Mishnaevsky Jr, 1998-01-01 This work examines problems particularly in mining and civil engineering related to the destruction of heterogeneous materials It details the physical mechanisms of destruction methods of damage and fracture modelling and the application of models to the improvement of drilling efficiency PROBAMAT-21st Century: Probabilities and Materials G.N. Frantziskonis, 2012-12-06 There are numerous technological materials such as metals polymers ceramics concrete and many others that vary in properties and serviceability However the almost universal common theme to most real materials is that their properties depend on the scale at which the analysis or observation takes place and at each scale probabilities play an important role Here the word probabilities is used in a wider than the classical sense In order to increase the efficiency and serviceability of these materials researchers from NATO CP and other countries were brought together to exchange knowledge and develop avenues for progress and applications in the 21st century The workshop began by reviewing progress in the subject area over the past few years and by identifying key questions that remain open One point was how to observe measure material properties at different scales and whether a probabilistic approach at each scale

was always applicable and advantageous The wide range of materials from wood to advanced metals and from concrete to complex advanced composites and the diversity of applications e g fatigue fracture deformation etc were recognized as obstacles in identifying a universal approach *The Physics of Metals and Metallography* ,1997
