V. THE INDICATIONS AND CONTRAINDICATIONS FOR DIGITALIS

Congestive Heart Failure

The prime indication for digitalis therapy is congestive heart failure resulting from defective myocardial contraction or from the inefficiency of excessive ventricular rate, or from a combination of the two. When congestive failure develops despite normal myocardial function (e.g. cardiac tamponade), digitalis is usually useless and may even be harmful. When the congestive failure is the result of a combination of mechanical factors (e.g. valvular stenosis) and of myocardial factors, (e.g. the dilation and/or hypertrophy that is

the invariable result of functionally significant valvular disease), the degree of effectiveness of digitalis varies and is difficult to predict. Even when the fault lies entirely in the myocardium, digitalis may be ineffective, especially in acute inflammatory and degenerative diseases of the heart muscle (e.g. acute rheumatic fever, diphtheritic myocarditis, typhus). However, as a rule, if the heart is enlarged and congestive phenomena are present, digitalis should be used and will be beneficial.

Heart Disorders with Rapid Ventricular Rate

Digitalis is valuable in the management of most disorders of cardiac mechanism that are characterized by a rapid ventricular rate. When heart failure is present the results are more consistent than when it is not.

(1) *Chronic atrial fibrillation* with rapid ventricular rate is a classic indication for
