Software Systems for Structural Optimization H.R. Hörnlein, K. Schittkowski, 2013-03-07 Herbert Hornlein Klaus Schittkowski The finite element method FEM has been used successfully for many years to simulate and analyse mechanical structural problems The results are accepted or rejected by means of comparison of state variables stresses displacements natural frequencies etc and user requirements In further analyses the design variables will be updated until the user specifications are met and the design is feasible This is the primary aim of the design process On this set of feasible designs the additional requirement given by an objective function e g weight stiffness efficiency etc defines the structural optimization problem In recent years more and more finite element based analysis systems were extended and offer now optimization modules They proceed from the design model as defined for structural analysis to perform an internal adaption of design parameters based on formal mathematical methods Despite of many common features there are significant differences in the selected optimization strategy the current implementation and the numerical results **Software Systems for Structural Optimization** Herbert R. Bestle, Werner Schiehlen, 2012-12-06 The International Union of Theoretical and Applied Mechanics IUTAM initiated and sponsored an International Symposium on Optimization of Mechanical Systems held in 1995 in Stuttgart Germany The Symposium was intended to bring together scientists working in different fields of optimization to exchange ideas and to discuss new trends with special emphasis on multi body systems A Scientific Committee was appointed by the Bureau of IUTAM with the following members S Arimoto Japan EL Chernousko Russia M Geradin Belgium E J Haug U S A C A M Soares Portugal N Olhoff Denmark W O Schiehlen Germany Chairman K Schittkowski Germany R S Sharp U K W Stadler U S A H B Zhao China This committee selected the participants to be invited and the papers to be presented at the Symposium As a result of this procedure 90 active scientific participants from 20 countries followed the invitation and 49 papers were presented in lecture and poster sessions **Hyperbolic Problems: Theory, Numerics, Applications** Rolf

Jeltsch, Michael Fey, 2012-12-06 **Hyperbolic Problems: Theory, Numerics, Applications** Michael Fey, Rolf Jeltsch, 1999-04-01 Infotext Kurztext These are the proceedings of the 7th International Conference on Hyperbolic Problems held in Z rich in February 1998 The speakers and contributors have been rigorously selected and present the state of the art in this field The articles both theoretical and numerical encompass a wide range of applications such as nonlinear waves in solids various computational fluid dynamics from small scale combustion to relativistic astrophysical problems multiphase phenomena and geometrical optics Volltext These proceedings contain in two volumes approximately one hundred papers presented at the conference on hyperbolic problems which has focused to a large extent on the laws of nonlinear hyperbolic conservation Two fifths of the papers are devoted to mathematical aspects such as global existence uniqueness asymptotic behavior such as large time stability stability and instabilities of waves and structures various limits of the solution the Riemann problem and so on Roughly the same number of articles are devoted to numerical analysis for example stability and convergence of numerical schemes as well as schemes with special desired properties such as shock capturing interface fitting and high order approximations to multidimensional systems The results in these contributions both theoretical and numerical encompass a wide range of applications such as nonlinear waves in solids various computational fluid dynamics from small scale combustion to relativistic astrophysical problems multiphase phenomena and geometrical optics

Numerical Solution of the Incompressible Navier-Stokes Equations L. Quartapelle, 2013-03-07 This book presents different formulations of the equations governing incompressible viscous flows in the form needed for developing numerical solution procedures The conditions required to satisfy the no slip boundary conditions in the various formulations are discussed in detail Rather than focussing on a particular spatial discretization method the text provides a unitary view of several methods currently in use for the numerical solution of incompressible Navier Stokes equations using either finite differences finite elements or spectral approximations For each formulation a complete statement of the mathematical

problem is provided comprising the various boundary possibly integral and initial conditions suitable for any theoretical and or computational development of the governing equations The text is suitable for courses in fluid mechanics and computational fluid dynamics It covers that part of the subject matter dealing with the equations for incompressible viscous flows and their determination by means of numerical methods A substantial portion of the book contains new results and unpublished material

Domain Decomposition Methods in Optimal Control of Partial Differential

Equations John E. Lagnese,Günter Leugering,2012-12-06 This monograph considers problems of optimal control for partial differential equations of elliptic and more importantly of hyperbolic types on networked domains The main goal is to describe develop and analyze iterative space and time domain decompositions of such problems on the infinite dimensional level While domain decomposition methods have a long history dating back well over one hundred years it is only during the last decade that they have become a major tool in numerical analysis of partial differential equations A keyword in this context is parallelism This development is perhaps best illustrated by the fact that we just encountered the 15th annual conference precisely on this topic Without attempting to provide a complete list of introductory references let us just mention the monograph by Quarteroni and Valli 91 as a general up to date reference on domain decomposition methods for partial differential equations The emphasis of this monograph is to put domain decomposition methods in the context of so called virtual optimal control problems and more importantly to treat optimal control problems for partial differential equations and their decompositions by an all at once approach This means that we are mainly interested in decomposition techniques which can be interpreted as virtual optimal control problems and which together with the real control problem coming from an underlying application lead to a sequence of individual optimal control problems on the subdomains that are iteratively decoupled across the interfaces
