Soil-Water-Solute Process Characterization Javier Alvarez-Benedi,Rafael Munoz-Carpena,2004-12-28 The practitioner or

researcher often faces complex alternatives when selecting a method to characterize properties governing a soil process. After years of research and development, environmental and agricultural professionals now have an array of methods for characterizing soil processes. Well-established methods, however, may not be suitable for **Quantifying and Modeling Soil Structure Dynamics**. Sally Logsdon, Markus Berli, Rainer Horn, 2020-01-22. Quantifying and Modeling Soil Structure Dynamics emphasizes a systems approach to how soil structure changes in response to inputs and to the environment. Soil structure is a dynamic complex system affected by tillage, wheel traffic, roots, soil life, shrink, swell, and freeze/thaw. In turn, soil structure affects root growth and function, soil fauna, solute transport, water infiltration, gas exchange, thermal and electrical conductivities, traffic bearing capacity, and more. Ignoring soil structure or viewing it as static can lead to poor predictions and management. Readers will especially appreciate the description of soil structure influence on endpoints such as environmental contamination and efficient water use, and how models should be adjusted to include dynamic soil structure components for accurate outputs.
