Soil Fertility Decline in the Tropics Alfred E. Hartemink, 2003 Wide coverage of soils and perennial cropping systems in the tropics Synthesis of decades of research Challenges assumptions on the benefits of plantations for soil fertility It is generally assumed that soil fertility decline is widespread in the tropics and that this is largely associated with annual cropping and subsistence farming In contrast perennial plant cover as in plantation agriculture provides better protection for the soil This book reviews these concepts focusing on soil chemical changes under different land use systems in the tropics These include perennial crops annual crops and forest plantations Two case studies on sisal plantations in Tanzania and sugar cane in Papua New Guinea are presented for detailed analysis The author demonstrates that soil fertility decline is also a problem on plantations

Forest Soils Khan Towhid Osman, 2013-12-12 Forest soil characteristics are not only unique but their interpretation also differs from cropland soils Just as there are diverse forest types there are many soil variants that need different management Today forest plantations are being intensively managed for profitable timber pulpwood and energy production Site selection species selection site productivity evaluation silvicultural treatments and soil amendments

need crucial soil information This book provides a comprehensive overview of the physical chemical and biological properties of forest soils and their implications on forest vegetation Topics discussed include major forest types of the world and their associated soils forest biomass and nutrient dynamics organic matter turnover and nutrient recycling forest soil disturbance forest soil and climate change and forest soil management and silvicultural treatments *The Red Soils of China* Michael Wilson,Zhenli He,Xiaoe Yang,2004-05-26 The red soils of China are typical in their chemical physical and mineralogical characteristics of red soils in other tropical and sub tropical areas of the world particularly in South America Africa and south east Asia For the most part these soils are highly weathered and inherently infertile They are acidic nutrient deficient poor in organic matter and have a low water holding and supplying capacity They cannot sustain arable cropping systems without the most careful management and are highly susceptible to soil erosion particularly on sloping land It is the purpose of this book to present recent research showing how the problems associated with using the red soils in China for sustainable agricultural production can be overcome using a variety of traditional and novel approaches In principle these approaches should be useful in other tropical and sub tropical countries faced with the problem of making the best use of their fragile red soil resources The term in principle is used deliberately because of course the different red soil countries invariably operate within dissimilar socio economic frameworks At the present time China may be considered to be in the process of an industrial revolution rather like that that took place in Britain in the late eighteenth and early nineteenth centuries **Soil Sampling and Methods of Analysis** M.R.
