Stalter,2004-02-27 This reference provides a complete discussion of the conversion from standard lead tin to lead free solder microelectronic assemblies for low end and high end applications Written by more than 45 world class researchers and practitioners the book discusses general reliability issues concerning

microelectronic assemblies as well as factors specific to microelectronic packaging. *Area Array Interconnection Handbook* Karl J. Puttlitz, Paul A. Totta, 2012-12-06 Microelectronic packaging has been recognized as an important enabler for the solid state revolution in electronics which we have witnessed in the last third of the twentieth century. Packaging has provided the necessary external wiring and interconnection capability for transistors and integrated circuits while they have gone through their own spectacular revolution from discrete device to gigascale integration. At IBM we are proud to have created the initial simple concept of flip chip with solder bump connections at a time when a better way was needed to boost the reliability and improve the manufacturability of semiconductors. The basic design which was chosen for SLT Solid Logic Technology in the 1960s was easily extended to integrated circuits in the 70s and VLSI in the 80s and 90s. Three I/O bumps have grown to 3000 with even more anticipated for the future. The package families have evolved from thick film SLT to thin film metallized ceramic to co-fired multi layer ceramic. A later family of ceramics with matching expansivity to silicon and copper internal wiring was developed as a predecessor of the chip interconnection revolution in copper multilevel submicron wiring. Powerful server packages have been developed in which the combined chip and package copper wiring exceeds a kilometer. All of this was achieved with the constant objective of minimizing circuit delays through short efficient interconnects.

**Microelectronics Packaging Handbook** Rao Tummala, Eugene J. Rymaszewski, Alan G. Klopfenstein, 1997-01-31 This thoroughly revised and updated three volume set continues to be the standard reference in the field providing the latest in microelectronics design methods, modeling tools, simulation techniques and manufacturing procedures. Unlike reference books that focus only on a few aspects of microelectronics packaging, these outstanding volumes discuss state of the art packages that meet the power, cooling, protection and interconnection requirements of increasingly dense and fast microcircuitry. Providing an excellent balance of theory and practical applications, this dynamic compilation features step by step examples and vital technical data simplifying each phase of package design and production. In addition, the volumes contain over 2000 references, 900 figures and 250 tables. Part I Technology Drivers covers the driving force of microelectronics packaging: electrical, thermal and reliability. It introduces the technology developer to aspects of manufacturing that must be considered during product development. Part II Semiconductor Packaging discusses the interconnection of the IC chip to the first level of packaging and all first level packages. Electrical test, sealing and encapsulation technologies are also covered in detail. Part III Subsystem Packaging explores board level packaging as well as connectors, cables and optical packaging.
